# PREFACE

The Government of Peru (GOP) has made poverty alleviation one of the cornerstones of its policy. Even so, in 1997 about 49 percent of Peru's population of 25 million people still lived in poverty, and 15 percent in extreme poverty. The World Bank's assistance program for Peru emphasizes support for the GOP's poverty reduction policies and investments. In order to guide its own work in helping the GOP deal with persistent poverty, to deepen its dialogue with government, and to inform public discourse, the Bank initiated a coordinated set of studies bearing on poverty reduction. The studies covered four topics: poverty itself, health, indigenous peoples, and education. This report conveys the findings of the education study. It seeks to inform discussion of potential policy options by examining the impact of public and private finance, and policies for resource use, on education and labor market outcomes. As such, it is one contribution to the larger discussion of human resource development and poverty reduction in Peru.

The GOP has viewed investment in education as essential for social cohesion, for personal and moral development, and for improving individual economic productivity and employment prospects. Educational improvements thus underpin strategies both for poverty reduction and for long-term economic and social development. The current situation reflects important accomplishments. Almost all Peruvian children enroll in primary education, and opportunities for secondary and higher education well exceed what would be expected for a country of Peru's income level.

Despite achievements to date, the new government inherits major problems that have received insufficient attention. Significant gaps remain—between the rich and the poor, between rural and urban areas, and between indigenous and nonindigenous populations—in school completion rates and learning outcomes. Overall challenges also remain for upgrading quality at all levels and for extending coverage of early childhood, secondary, and higher education. One path into the 21$^{st}$ century would pursue steady incremental improvements of the current situation. Another path for policy would seek a marked improvement in the intellectual and technical capacity of the population through a focussed commitment to closing gaps and meeting remaining challenges. The new government has thus arrived at a crossroads in education policy.

This report reviews the period from 1990 to 1997. The study has limited its scope to analyzing data made available in or before 1997, but has not been able to take advantage of data that have been made public since the events in late 2000 and early 2001. While not incorporating newly released data, we have concluded after an intial review of this material that it does not change the general picture outlined herein.

This World Bank document reports the work not only of its own staff but, also, to an unusual extent, that of Peruvian academics, policy analysts, and public officials. The document reflects a collective effort.

## EXECUTIVE SUMMARY

Peruvian education has achieved notable successes in the second half of the 20th century. Primary education now reaches almost all children. Secondary and tertiary education institutions enroll about 80 percent of the 12- to 16-year olds and 30 percent of the 17- to 25-year olds, respectively. Few countries in Peru's income range achieve comparable coverage. These accomplishments are particularly impressive given Peru's geographical and ethnic diversity.

The government in the 1990s steadily increased public expenditure on education, despite constraints imposed by disciplined fiscal policies. Nonetheless, at 3 percent[1] of Gross Domestic Product (GDP) in 1997, Peru's public spending on education remained significantly less than the Latin American average of 4.5 percent.

That Peru was able to attain high enrollment with a low level of public spending results from several factors: (i) achievement of near universal primary education before qualitative improvement; (ii) containment of the growth of personnel expenditure, channeling the additional public resources to build up infrastructure and capacity; and (iii) mobilization of high levels of household expenditure on education (total household spending on public and private education accounted for about 2 percent of GDP—much higher than the OECD's 1.3 percent). These factors operated in the context of what might be labeled a first generation of reform occurring in the early 1990s. This reform was characterized by rationalization of the public sector, regionalization of administration, deconcentration of social services, encouragement of private education, and extension of free and compulsory education.

Despite these accomplishments, important challenges remain. Disparity between the rich and poor—and between rural and urban areas—remains pronounced in access to preschool, secondary education, and tertiary education, as well as in school completion rates. Disparity is also manifested in levels of achievement between indigenous and nonindigenous populations, and between public and private schools. Meanwhile, the earnings differentials between workers with different levels of education are growing. In urban areas, the largest increase in earnings differentials is between university educated and secondary educated workers. This signals a growing demand for higher skill levels in an open economy that is facing increasing international competition and technological change. These trends have serious implications for the employment prospects and future lifetime earnings of disadvantaged groups.

Peru has thus reached a crossroads for education policy at the beginning of the 21st century. The status quo reflects major accomplishments. One direction for policy would, therefore, involve useful but relatively limited improvements in the current situation. This direction, however, may prove inadequate to fulfill the country's goal of having a highly

---

[1] In Peru, pensions are paid out of the recurrent budget of each ministry, not out of a separate pension fund as in many other countries. Pensions accounted for about 21 percent of the total public expenditure on education. Net of pension, public spending on education accounted for only 2.4 percent of the GDP in 1997.

educated citizenry—fully competitive by international standards—to underpin poverty reduction and to facilitate economic and social development. A second generation of reform would be required if this direction were taken. This study explores these issues and lays out options for a second wave of reform.

Either of the broad directions for policy will need to identify specific ways of improving educational quality. This report analyzed the factors affecting fourth graders' mathematics achievement levels in 1996 to identify options to improve quality. The findings are encouraging in indicating potential directions where change could make a difference:

The analysis found that *after controlling for a number of explanatory variables*, the performance of poor and extremely poor departments was better than nonpoor departments. Some departments were doing a better job in educating over-aged students. Aymara students performed as well as Spanish-speaking students. Quechua students could achieve as much as others if they were not studying in predominantly Quechua-speaking schools, thereby indicating the potential for policy to reduce the disparity by increasing support to these schools. Teachers who graduated from universities and from Institutos Superiores Pedagógicos, teachers who have had longer years of service, and teachers who have had more in-service training courses, were positively associated with higher student achievement, relative to those teachers who have not had these qualifications, years of service, and training opportunities. Nonavailability of textbooks was associated with lower achievement. Parental expectations—potentially modifiable through publication of assessment results and learning determinants—helped shape outcomes. Even within the limitations of this first assessment effort, the findings are sufficiently important to warrant attention for the policy possibilities to equalize educational outcomes and improve quality more generally.

Because the burden for financing education is disproportionately heavier for poorer than richer households, public policy cannot rely on general increases in income to bring improved educational quality for disadvantaged populations. Increases in public sector investment will be required to ensure the equality of educational opportunity for all and improved economic opportunity for all—by directing more public resources to the poor. Past constraints on public expenditure allow room for new allocations to meet this mandate without exceeding reasonable overall public allocations to the sector. But increased public commitment to education will prove to be of little value unless the resources are committed not only to the right groups but also to the right interventions.

To level the playing field for all Peruvian children, then, it is necessary to improve equity, quality, and efficiency. All countries face these challenges. In Peru, the policy options to meet them include the following:

- *Improving equity*: Government support can come in the form of proven supply-side interventions. These include extending the current provision of each class with a set of instructional materials and supplies from primary education to preschool and secondary education; expanding provision of bilingual education programs and texts;

stepping up recruitment and strengthening training of indigenous teachers; training rural teachers in multigrade teaching; providing incentives to rural teachers; extending cost-effective health and nutrition programs for school-age children; and expanding access to secondary education (in part by establishing distance learning programs). Also important are demand-side financing measures (such as grants and scholarships targeted to rural areas and indigenous students, particularly girls).

- *Improving quality*: Many of the interventions just listed to improve equity will also enhance quality. Additional options include: changing the system of incentives — such as adjusting the salary scale to reward higher levels of skills and competency and to compensate for the difficult working conditions in the rural areas, opportunity for professional development, and open-ended tenure to be determined by performance. Setting standards for learning and teaching, strengthening teacher pre-service and in-service training, teacher performance evaluation, and rewarding schools for improved performance (perhaps through formula-based funding) are among the options to sustain the efforts to enhance quality. These measures require complementary improvement in the frequency, quality, and transparency of student assessment (with results available to administrators, principals, teachers, parents, students, and the general public); the recently introduced program of national testing provides an excellent start in this direction. Building consensus with all stakeholders on the direction and means for change will be critical to build a culture of accountability.

- *Improving efficiency in planning and policy*: Efficiency objectives can be advanced by (i) strengthening coordination of educational policy and financial matters between the budgetary entities that have responsibility for education (Ministry of Education, the Regions, universities, decentralized institutions, and Ministry of the Presidency, as well as the Ministry of Women and Human Development); (ii) proactive gathering of information on teachers and school-level finance (in both public and private schools) to guide policy; and (iii) using student achievement data systematically to target additional resources for schools falling below certain performance levels, while recognizing schools which have made above average progress over time.

Some measures are easier to implement (such as provision of educational materials) than others (such as setting standards to drive development of teacher professionalism) because the latter involve institutional and cultural change. Therefore the timeframe of implementation will vary.

Many countries have committed far more public resources to education than has Peru, but without achieving universal coverage for basic education. For these countries, increasingly binding fiscal constraints and continued needs to expand coverage of basic education sharply constrain the policy agenda. Peru, in contrast, has positioned itself at a crossroads. One direction to take involves continuation and improvement of the system much as it currently is. On the other hand, Peru has achieved the preconditions to initiate a major drive to consolidate equity gains and expand access while improving quality. Choosing this path would require, over time, substantially increased public expenditures

on education. A gradual increase from 2.4 percent to 4.5 percent of GDP net of pension expenditures (that is, to the Latin American average) is, for Peru, feasible in the medium term, given its past demonstrated ability to maintain fiscal discipline and to improve macroeconomic performance. By increasing public expenditure levels to only the Latin American average, Peru has the opportunity to enhance markedly the intellectual ability and competitiveness of its labor force within a generation. No policy challenge is more significant.

# Chapter 1. Sector Overview

As a lower middle-income country with a Gross National Product (GNP) per capita of $2,460 in 1997,[1] Peru has made impressive progress in extending education opportunities over the last five decades. Between 1950 and 1997, enrollment expanded 6.6 times, more than double the three-fold increase of the population.[2] Total enrollment grew from a mere 14 percent of the population in 1950 to 36 percent in 1997. As a consequence, over the period, the average education level of the population of age 15 and over increased from 1.9 years to 8.6 years,[3] and the illiteracy rate was reduced from 58 percent to 11 percent. Female illiteracy was reduced from 70 to 18 percent, and rural illiteracy from over 60 to 29 percent. These are impressive accomplishments in a country as physically and ethnically diverse as Peru, particularly in view of its recent history of macroeconomic instability and civil unrest. Chapter 1 summarizes achievements to date and describes recent developments and issues in the sector.

## 1.1. Achievements

In 1997, school enrollment was practically universal for the 6- to 11-year olds, about 80 percent of the 12- to 16-year olds, and over 30 percent of the 17- to 25-year olds.[4] The education system now encompasses about 8 million children and adults, of whom 6.7 million are in the public, formal system. (See Background Note 1 for the structure of the education system, Appendices 1 to 3 for education statistics, and Appendix 4 for gross and net enrollment ratios.)

International comparison shows Peruvian enrollment ratio in a remarkably favorable light, as is presented in Figure 1. Each bar in the figure stands for a particular country in the World Bank's education database, and Peru is high up on the list, where the neighbors on the graph are mostly developed nations.

When international comparison is made of the level of public spending on education as a percentage of Gross Domestic Product (GDP), however, the position of Peru changes, as is shown in Figure 2, which is also drawn from the same World Bank database. In the second graph, the neighboring countries include a number of low-income countries.

[1] See World Bank, 1998b, *World Development Report*, p. 191.

[2] See Díaz, Huayte, Farro, and Távara (1995, p. 22), which cites Instituto Nacional de Estadística e Informática (INEI) and Ministry of Education (MED) statistics.

[3] The average of 1.9 years of education corresponds to the national census of 1940. The 8.6 years of education is based on the National Survey of Living Standards by INEI (Encuesta Nacional de Niveles de Vida, or ENNIV), 1997.

[4] The findings were based on analysis of a household survey conducted by Instituto Cuanto in 1997. The Cuanto dataset was more extensive in its questionnaire about education expenditure than the government's INEI dataset. Therefore, it was used for this study.

These figures provide a compressed account of achievements to date and also pose a question: what can explain the puzzle that Peru has been able to achieve an unusually high participation rate with a relatively low level of public spending on education? How has this been accomplished? Answering this question raises the main policy issues that this report addresses. Several hypotheses for explaining the puzzle are investigated and their policy implications are discussed:

(a) Is it because public resources have been well used and well targeted?
(b) Is it because Peruvian households value education highly and spend heavily on education?
(c) Has expansion of access to basic education come at the expense of qualitative improvement?
(d) Is the low level of public spending attributable to the ability to contain the salary cost of teachers? How does this and other policy on teachers affect the profession?

The chapters in the report correspond roughly with the above questions. Chapter 1 sets the context for discussion by summarizing achievements to date and by describing recent developments in the sector. Chapter 2 reviews public expenditure on education in order to address the question of whether public resources have been used efficiently and equitably; it also examines private spending on education to assess the impact on equity. Chapter 3 analyzes indicators on access, school survival rates, quality, and labor market outcomes to evaluate the tradeoff between quantitative expansion and qualitative improvement within the constraints of public and private finance. Chapter 4 reviews the policy towards teacher employment and deployment, conditions of service and compensation, incentives and accountability. Chapter 5 explores the options for improving equity, quality, and efficiency, and discusses the resource implications.

## 1.2. The Evolving Education System

Many of the policy changes that have taken place in Peru in the 1990s represent, to a considerable extent, a break with the past. The evolution of this policy environment must be viewed against the economic and political crises of the late 1980s. Fiscal deficit (which included debt servicing) was equivalent to 10 percent of GDP in 1988. Hyperinflation cumulated to a rate of over 7,000 percent in 1990. Insurgency was rampant in the countryside and at times in the cities.

The year 1990 marked a turning point. Structural adjustment under the Fujimori Administration restored fiscal discipline. Sound macroeconomic management, in combination with the ending of the Shining Path insurgency in 1994, gradually set the economy on a growth path. By 1997, a balanced budget (which included debt servicing) was achieved; savings in the current account progressively increased to 4.4 percent of GDP; and both GDP growth and inflation were estimated at around 7 percent each. Before the effects of the East Asian financial crisis was spread to Latin America in 1998, Peru's economic growth rate was second only to that of Chile in the region. Although the economy suffered a downturn in subsequent years, its past demonstrated ability to turn the economy around indicates the potential once political and economic stability is restored.

3

In the first half of the 1990s, along with major reform of macroeconomic policy, a series of measures were implemented to contain public expenditure, to mobilize private resources, and to delegate social services to the regions. These measures and the changes they set into motion are as follows:

- Rationalization of the public sector and introduction of a private personalized pension plan

Retrenchment of government services between 1991 and 1993, which resulted in a reduction in employment in the central administration of the Ministry of Education (MED) by 72 percent.[5] Vacant or new positions in the Ministry are filled by consultants on contract. To contain personnel expenditure, authorized pensionable positions (APP) for the entire sector have been frozen since 1995.

In 1994, a new personalized pension plan (AFP) (Law 25897), modeled after the Chilean private pension plan, was introduced.[6] People on public payroll, including teachers, are given the option of choosing whether they want their pension to be covered by the previous laws, or have the individualized account which they can invest with a private company for capitalization. Since it is a personalized plan, they can take the pension

---

[5] World Bank, 1994b: *Peru: Public Expenditure Review,* Report No. 13190-PE, p. 50.

[6] Before the reform, two laws governed the pensions for teachers:

(1) Law 20530, which affects those teachers who joined the service before 1980, has no minimum retirement age. It allows female retirees to receive 7/25 and male retirees to receive 7/30 of their basic salaries after they have contributed 6 percent of their basic salaries for 7 years. Female retirees who have worked for 25 years and male retirees who have worked for 30 years are entitled to 100 percent of their basic salaries. Pension benefits are not only fully adjusted for inflation, but will be linked to the salary increments of current serving employees. When pensioners were still in active service, they also contributed 9 percent of their salaries to social security (Instituto Peruano de Seguro Social or IPSS) and 5 percent to a housing fund (Fondo Nacional de Vivienda or FONAVI), while the employer (that is, MED) contributed 6 percent. Pensioners have to continue to contribute 4 percent of their pension to the Treasury in order to enjoy the benefits.

(2) Law 19990, which affects those teachers who joined the service after 1980, imposes a minimum retirement age of 55 for women who had completed 25 years of service, and 60 for men who had completed 30 years of service. Pension benefits were fixed and not adjusted for inflation. Active teachers have to contribute 13 percent of their basic salaries, 9 percent to IPSS and 5 percent to FONAVI.

There is no doubt that the pension provided under Law 20530 was very generous, and provided coverage to those who might be as young as their late thirties and early forties (which are the age groups of the last cohort of ISP graduates who joined the teaching profession before 1980). In fact, Law 20530 provides a strong incentive for teachers to retire with pension and start a second career, such as teaching in or founding private schools. It was not surprising that the retrenchment of the early 1990s resulted in launching the second career of many enterprising persons in this sector. The incomplete system of data collection left the Government unable to calculate the total number of teachers and their age structure governed under these three retirement laws. This has made it difficult to project the total pension obligations of the education sector. The pension issue has been a dominant one in public expenditure on education. The reform has stopped future drain on public expenditure.

4

wherever they are employed.[7] Salaries paid to teachers who choose the personalized pension plan are higher than those under previous laws in order to provide incentives for conversion (Appendix 6.19). Meanwhile, the Government has created a Pension Office (Oficina de Normalizacion Previsional, or ONP for short) which will eventually handle all pension matters. The new personalized pension plan is expected to lessen the burden of the state treasury and make employment more flexible by de-linking it with specific employers.

These measures to contain public expenditure, along with other policies, helped restore fiscal balance. These, however, came at the cost of low morale in the public sector, which could ultimately undermine high performance. Cost containment alone could not result in efficiency gain without concomitant use of transparent criteria for personnel recruitment and resource allocating, setting up of incentives to reward performance, and introduction of accountability. Towards the second half of the 1990s, there has been increased attention to these complementary needs.

Competitive examinations were introduced in 1997 to select new principals and teachers to fill vacant authorized pensionable positions (APP). A national student assessment program was set up in 1996 to monitor achievement. These measures, although still in an early stage of implementation, provide the building blocks towards the establishment of a merit-based system. Further policy guidelines on standards for teachers and students, strengthened pre-service and in-service training, and incentives and accountability, backed up by resources to fund them, would counteract the morale issue, professionalize the teaching force, and improve the quality of education.

• **Extension of free and compulsory education in the 1993 Constitution**

The Constitution of 1993 extends compulsory and free education from primary to secondary education. In 1997, a proposed structural change of the education system redefined basic education by extending downward by one-year to include initial education for 5-year-old children, and by shortening secondary education from five to four years. This will make the overall duration of basic education 11 years. The plan is to progressively extend universal initial education to cover children of four years of age, and then, those of three years of age. Since secondary education was shortened, it is compensated by the introduction of two years of preparatory course work (*bachillerato*) which is not compulsory but free and will provide the transition to tertiary education or to the world of work. Certificate examinations will be held at the end of basic education, *bachillerato*, and tertiary education (Table 1).

This structural change has far reaching implications on the resource requirements to implement the policy, the supply and demand for teachers at different levels and in different subject specialties, and the content and methods of teacher in-service and pre-

---

[7] Employees who choose private pensions have to contribute 11 to 13 percent of their basic salaries to future pension, and 5 percent to FONAVI, while the Government contributes 9 percent to IPSS to cover health insurance.

service training. How various components of the proposal can be synchronized remains to be worked out.

| Table 1: A Comparison of the Existing and New Education Structures | | | | |
|---|---|---|---|---|
| Age | Existing Structure | Age | New Structure | Objective of Change |
| 3-5 | Nonuniversal initial education | 5 | 1 year of universal initial education at the age of 5 | Facilitate the articulation between initial and primary education to improve efficiency of the system |
| 6-11 | 6 years of universal primary education of uneven quality | 6-11 | Duration of primary education remains unchanged, but emphasis is on improving the quality | Develop the capacity of learning |
| 12-16 | 5 years of secondary education that has uneven access between rural and urban areas | 12-15 | 4 years of universal secondary education | Guarantee free access and the use of distance education for rural areas to extend coverage. 1 year of preschool, 6 years of primary, plus 4 years of secondary education will form *11 years of universal basic education*. Certification of study at the end of basic education. |
| | | 16-17 | 2 years of bachillerato is a new introduction. It is not compulsory but free in public schools. | Preparation for work and for tertiary education. Certification of study at the end of bachillerato. |
| 17- | Tertiary education | 18 and over | Tertiary education | Remains unchanged. |

Source: MED, *Nueva Estructura del Sistema Educativo Peruano: Fundamento de la Propuesta*, 1997.

- **Encouragement of private schools**

Complementary to the need to contain public spending and to the constitutional mandate for expanded compulsory education is a new law that encourages establishment of private schools. This legal framework, combined with retrenchment of education administrators and teachers, has led to a rapid growth of private schools.[8] This supply has met the demand of parents who have grown weary of frequent closing of public schools due to teachers' strikes in the early 1990s, who consider the quality of public education unsatisfactory, and who can afford to pay for private schools. (See Figures 3 and 4 for increase in enrollment in public and private schools.)

---

[8] There are a number of private schools: secular schools, cooperative schools, Catholic and other religious schools, all of which are privately financed and privately run. In addition, there is *Fe y Alegria*, which is operated by the Catholic Church, but financed by the State.

**Figure 3. Trend of Enrollment in Public Institutions by Level, 1990 to 1997**

Source: Ministry of Education
**Figure 4. Trends of Enrollment in Private Institutions by Level, 1990 to 1997**

Source: Ministry of Education
Between 1990 and 1997, enrollment in private education grew by 62 percent in initial education, 9 percent in primary education, 28 percent in secondary education, and 37 percent in tertiary nonuniversity education (MED statistics). This outpaced the rate of increase at these levels in the public sector, which grew only by 34 percent in initial education, 8 percent in primary education, 10 percent in secondary education, 25 percent in tertiary nonuniversity education.[9] Within the rapidly expanding tertiary nonuniversity sector, private teacher training institutions accounted for a significant share. (See Appendices 1.1 and 1.3.)

The overwhelming majority of private school students are from the richest consumption quintile of the country. For example, in the urban areas, these students accounted for as much as 39 percent of net enrollment in the 6 to 11 age group, 27 percent of the 12 to18 age group, 21 percent of the 17 to 25 age group (Appendix 4.3d). A significant percentage of the fourth quintile also chose private schools. By contrast, there were less than 1.5 percent of students from the poorest quintile of all age groups in private schools. In the rural areas, overall, there was not even 1 percent of children of all age groups in private schools. In the public school system in urban areas, net enrollment of the richest quintiles in primary education (53 percent) was much lower than that of the poorest quintile (85 percent) (Appendix 4.2d). The implications for policy will be discussed in Chapter 2.

- **Setting up of regional administration, deconcentration of education services, and creation of new ministries**

The 1993 Constitution also restructures the political system. It divides the country into regions, departments, provinces, and districts.[10] At each region, the Transitory Council of Regional Administration (Consejos Transitorios de Administración Regional or CTAR in short) coordinates all regional affairs and finances. In the case of Lima and Callao, the Development Corperation of Lima and Callao (CORDELICA) serves a similar function as the CTAR. The CTARs and CORDELICA are directly under the Ministry of the Presidency (PRES).

PRES was created at the same time. Not only does it coordinate the region's education budget but also has responsibility for most of the capital expenditure on education

---

[9] The decline in public and private university enrollment in official statistics is inconsistent with reality. The most probable reason is due to nonreporting in the case of private universities. As for public universities, the dramatic decline in enrollment between 1996 and 1997 is most probably because only the registration in the first semester is taken into account. Normally, registration in both semesters would be averaged out for the entire academic year. The figure for 1997 was probably not yet updated. An informal survey by the World Bank found that enrollment in public universities has remained stable in the 1990s, while that in private universities has grown rapidly.

[10] The political levels that have elected offices are the central government and the municipal government (provincial and district municipal governments). The central government has an elected president and congress. The provincial and district municipal governments have their respective elected mayors and councils. The CTAR each appoints a president and a regional coordination council.

through National Infrastructure for Education and Health (Infraestructura Nacional para Educación y Salud, or INFES in short).

While the central government and the municipal governments have their own revenue sources, the regional administrations do not, and depend on the central government for transfer of revenue. Regionalization of administration has affected the budget process, intragovernmental allocation of resources, and the balance of power between various ministries in the center and the regions.

In education, MED retains the overall responsibility for setting education policy on preprimary, primary, secondary, vocational, and tertiary nonuniversity education, but not on university education. Public universities remain autonomous and outside the jurisdiction of the MED or regional administrations. They have their own coordinating body, the National Assembly of Rectors (Asamblea Nacional de Rectores). A new ministry, Ministry for the Promotion of Women and Human Development (Ministerio de Promoción de la Mujer y del Desarollo Humano or PROMUDEH in short), which was created in 1996, is in charge of early childhood care for children from birth to four or five, and the literacy program.

MED is charged with the missions of developing the character of the individual, improving the quality of life, and facilitating social development in Peru through promotion of culture, science and technology, physical education, and pursuit of excellence. The responsibility for provision of educational services from preschool to tertiary nonuniversity education has been delegated to 23 Regional Education Directorates (Direcciones Regionales de Educación or DREs in short) which sit within the regional administration, and to the Directorate of Education in Lima and that of Callao. MED makes educational policy for the entire nation, and gives technical and normative directions to the DREs, which implement policies. The Education Director of Lima is appointed by the Minister of Education, and the other Regional Education Directors are also appointed by the Minister with the approval of the regional administration.

Under the DREs are Areas of Execution (AEs), Educational Service Units (Unidades de Servicios Educativos or USEs for short), and Education Development Areas (Areas de Desarrollo Educativo or ADEs in short).[11] The USEs manage some 58,000 schools and about 18,000 nonformal educational programs, both public and private (Figure 5). Both AEs and USEs are administrative units, but ADEs are educational supervision and support units. USEs are line units executing the functions and budgets of the DREs or Sub-DREs.

Each DRE is headed by a director, who is assisted by two committees: one composed of the heads of subordinate units (Sub-DREs), another composed of the heads of internal line units, such as internal control, administration, legal and technical advisors'

---

[11] Decree 26011 provides the framework for decentralization of educational administration and management, and transfers the private right to Communal Councils of Education (Consejos Comunales de Educación or COMUNED) for the administration of public schools. But months after the approval of the law, it was decided that it would not be implemented.

office, and technical pedagogic and technical cultural departments. Sub-DREs and USEs are organized essentially along the same lines.

**Summary.** Policies implemented since 1990 have irrevocably changed the education system. Containment of public spending and mobilization of private resources may be loosely considered as the first generation of reform. Important achievements ensued. Yet, in the course of implementation, many issues have arisen that must be addressed in order for the sector to move forward. These issues have largely defined the scope for a second wave of reform which must deal with remaining inequities, quality improvement, further expansion, and institutional issues. Table 5 at the end of Chapter 5 provides an overview of how these new measures cross cut with the issues of public and private finance, quality, efficiency and equity, and the teaching profession.

10

# Chapter 2. Education Finance

Two key questions in the puzzle posed at the beginning of the report are whether Peru's ability to finance high level of enrollment is because public resources have been used efficiently and equitably and whether households spending on education is high. This chapter evaluates these questions by first reviewing public spending on education and then by looking at the magnitude and impact of household financing. It then discusses the policy implications.

## 2.1. The Budget Process

To understand public finance of education in Peru, it is important to first understand the budget process. The fiscal year in Peru coincides with the calendar year as well as the school year. The budget process begins in May every year when the lowest units submit their budget requests for the following year. The Ministry of the Economy and Finance (MEF) consolidates all requests in August and presents to the Congress in September. The Congress approves the budget in November/December for funds to be allocated in January.

There are five budgetary entities in education: (a) MED, which covers the greater Lima/Callao area, (b) regions, (c) public universities, (d) other decentralized institutions, and (e) PRES. The first four are entitled primarily to handle recurrent expenditure under their jurisdiction, while the last one is responsible for investment and, hence, controls most of the capital expenditure through INFES.[12]

Since the establishment of regional administration in 1991, each of these entities prepares their own budget and negotiates directly with MEF.[13] The process begins when schools present their requests for recurrent budget to the USEs, which submit a consolidated request to the DREs which, in turn, forward the aggregated budget to the CTARs. These budgets are consolidated in PRES, and then presented to MEF. MED's budget which also covers greater Lima and Callao and some national programs are submitted directly to MEF. The universities and decentralized institutions submit their own respective budgets directly to MEF. PRES also presents its budget for capital expenditure in education directly to MEF. Coordination is weak between MED and the regions, between MED and PRES, and between the regions and PRES.[14]

---

[12] The budget for PROMUDEH, which has responsibility for literacy programs and early childhood care, is not consolidated with education. The budget for these activities is very small. Since PROMUDEH was created only in 1996, this report does not cover this new ministry.

[13] In principle, this practice was to have changed after April 1, 1998, to have MED coordinate all recurrent budgetary matters for the regions. The new process was supposed to enable MED to have an overview of the nation's education budget and spending patterns. However, this was implemented for only three months and then there was a reversion to the old process.

[14] DREs have little control over their own capital investment. For example, since all the education allocation to them covers only recurrent spending, if DREs want to buy a computer for

Under this process, MED does not have complete information about what the regions have requested and the regions do not report to MED about their actual expenditure. Therefore, much of the policy by MED which has national application has been made without clear information on the requirements and availability of resources in the country. MEF has the ultimate say over allocation of education resources but without having an overall view of priorities and strategies in the education sector. There is no coordinating body in education that can assure the coherence of policies and provide the necessary resources to support them.

MEF's decisions for allocating resources are based on the availability of public funds to match with what have been requested by MED and the DREs to deliver services. The first obligation is to pay salaries and pensions, and then to meet the needs for providing basic services of each of the entities. There are no funding formula to allocate resources other than the aforementioned priorities. Funds are allocated on a quarterly basis, but spent on a monthly basis. Funds not used as planned every month have to be returned to MEF at the end of the month, to be deposited back to the public treasury. There is no incentive to award savings.

The main ground for allocating recurrent budgets to each DRE is the number of authorized pensionable positions (APPs) for teachers and administrative staff. These positions, in turn, are based on the ratio of allocating, on average, one teacher for every 35 students in the urban areas, and one teacher for every 20 students in rural areas, with some variations by level and for remote areas. On the surface, this method of allocation has given special consideration to the rural areas. However, the 20 students in the rural areas may be of different ages and grade levels, and the teacher does not have a full range of skills to meet all of their educational needs. Moreover, since the freeze of pensionable positions in 1995, the departments that have high birth rates (usually poorer and with a larger indigenous population) have been more adversely affected than others.

Teachers and administrators in the urban areas are paid monthly through deposit to their bank accounts although some are paid by checks; most of those in rural areas are paid by check. Textbooks, library books, and other educational materials and supplies are generally purchased by MED at the central level and are delivered to DREs, which distribute them to all schools under their jurisdiction. Electricity and water for evening schools are paid by the USEs. For many schools, parents' contribution pay for water and electricity. Many rural schools have neither water nor electricity.

Given the fragmentation of the budgetary process, there is a strong case for improving coordination among various budgetary entities to assist the coherence of educational policy and raise efficiency in resource allocation to the sector as a whole. Equally strong is the case for improving the consistency, flexibility, and transparency of funding decisions through formula that reward efficiency and allow for adjustment to local needs.

---

use in the office, they have to submit a separate request to the CTARs for incorporation into the regions' capital budget request.

## 2.2. Public Expenditure on Education[15]

**Historical trend.** Government allocation constitutes the most important source of funding for education in Peru. Enrollment growth, however, has far exceeded the growth rates of either the GDP or public expenditure on education. Between 1970 and 1990, GDP increased by 85 percent in real terms, total government expenditure by 84 percent, public expenditure on education by 72 percent, while enrollment in public institutions by 130 percent (Appendix 6.2).

Public spending on education fluctuated widely throughout the 27 years under review. Between 1970 and 1997, public expenditure on education[16] peaked in 1972 at 3.7 percent of GDP, falling to 2.2 percent in 1988 at the lowest point, and recovering to 3 percent in 1997.[17] The steep decline in public spending on education in the late 1980s reflected the extremely volatile macroeconomic environment. In 1988, when GDP contracted by 8.4 percent in real terms and total government expenditure by 29 percent, total public spending on education declined disproportionately by 40 percent (Figures 6 and 7, Appendices 6.1 and 6.2).

The recovery of public spending on education in the 1990s started from this extremely low base in the late 1980s. After declining in real terms by 40 percent in 1988, 10 percent in 1989, and 7 percent in 1990, allocation to education increased annually by some 3.6 percent in 1991 and 1992, respectively, by 18 percent in 1993, by 23 percent in 1994, and by 20 percent in 1995. It was reduced by 7 percent in real terms in 1996 but rose by 18 percent in 1997. The overall trend in the 1990s is a reversal of that in the 1980s: education expenditure has increased at a higher rate than that of GDP or total government expenditure (except for two years) (Figure 7). This trend indicates the government's commitment to education. Consideration for fiscal balance, however, has led to a gradual approach to increasing public spending on education. The enormous fluctuation of public expenditure on education over time, nonetheless, reflected deep-seated instability and unpredictability in resource allocation, which made it difficult for strategic planning, and undermined continuity of projects.

---

[15] This review of public expenditure on education by Juan Pablo Silva of the Ministry of Education and Arturo Miranda of Universidad de San Marcos has updated and deepened the analysis by Jaime Saavedra, Roberto Melzi, and Arturo Miranda (1998). Jaime Saavedra reviewed the work to ensure consistency in methodology.

[16] This review focuses on direct public expenditure for educational institutions, which coincides with the Government's official account of public education spending. It does not examine public subsidies to households such as school health and school meals, which is funded under the Ministry of Health and PRES, or early childhood care and the literacy program under PROMUDEH. The reason for doing so is to ensure that the scope of discussion remains focused. It is also consistent with OECD's classification, which divides public expenditure into three groups: (a) direct public expenditure for educational institutions, (b) total public subsidies to households and other private entities, and (c) financial aid to students not attributable to households (see Appendix 10.1). When the scope of the review is clearly defined, it would be possible to compare across countries.

[17] This includes external finance, but not interest payment from borrowing.

14
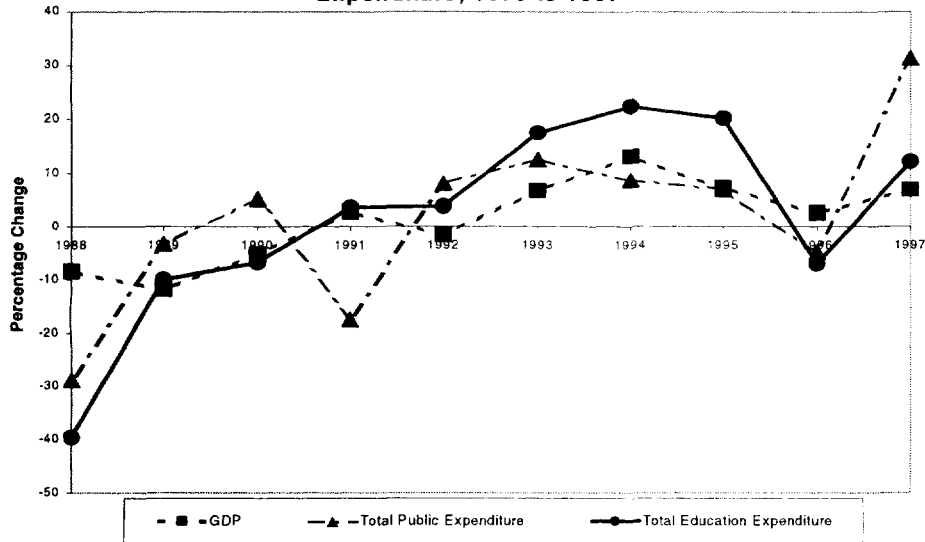

The level of public spending on education in Peru is low in comparison with other non-socialist lower-middle-income countries (Figure 8). It is substantially lower than the Latin American regional average of 4.5 percent of GDP (UNESCO, 1998), or the OECD average of 4.8 percent[18] (OECD, 2000). Because the school-age population of OCED is much smaller than that of Latin America, even if the level of public spending on education as a percentage is similar, the need for educational services is proportionally higher in the latter. In Peru, about one-third of the population are attending schools, in contrast to 16 percent in France and the United Kingdom, respectively, 14 percent in Japan, 28 percent in Mexico, 26 percent in Colombia, and 23 percent in Chile. This comparison makes Peru's level of public spending even lower in both relative and absolute terms.

It should be noted that pensions of retired teachers and administrators are paid out of the recurrent expenditure on education. This accounted for 22 percent of the total education expenditure in 1997. *Net of pensions, public expenditure on education was about 2.4 percent in 1997.* Many countries[19] pay pensions out of a separate fund, such as a provident fund which may be invested in the capital or financial markets to increase the fund, not from the recurrent allocation to the sector. Although public education expenditure that includes pensions reflects the true cost of education, when comparison is made with other countries' spending levels, the proper way is to compare public expenditure net of pensions. This will make Peruvian public spending on education as a percentage of GDP less than half of the region's average for most of the years in the 1990s. While it is a tribute to MED and the teaching profession to be able to sustain such high enrollment ratios at all levels with so little resources, the situation highlights the predicament of the education sector, with adverse implications for quality.

**Figure 8: Public Spending on Education and GNP Per Capita in Lower-Middle-Income Countries**

Source: Edstats database of the World Bank

---

[18] The OECD's average cited here refers to educational institution-related expenses, but excludes educational subsidies to households, and student financial assistance.

[19] Paying pensions out of the sector's recurrent expenditure is uncommon, except in socialist countries such as China. The United States, Singapore, Hong Kong, South Korea, Jamaica, Trinidad and Tobago, Colombia, Chile, Mexico, and Argentina pay pensions from a separate fund.

**Changes in composition of education spending.** What did the additional public expenditure in the 1990s finance? Unlike many countries where most of the increase in public expenditure on education has been absorbed in personnel cost, Peru put the additional resources in educational infrastructure, in quality enhancing inputs (such as textbooks), in teacher training, and in capacity building. For example, the World Bank Project for Improvement of Quality of Basic Education (Mejoramiento de la Calidad de la Educacion Primaria or MECEP in short) finances a class-set of free textbooks for all grades in primary education throughout the country.

Capital investment increased from 1.4 to 15 percent of total public expenditure on education between 1990 and 1994, and then gradually fell back to 8 percent in 1997. Spending on other capital goods also increased from 1.4 to 2.1 percent. Spending on goods and services as a percentage of total education expenditure more than doubled from 4 to 10 percent, and other recurrent costs also more than doubled from 0.7 to 1.8 percent. It should be noted, however, that the fluctuation in nonpersonnel education expenditure still bore the mark of unpredictability, which undermines planning and implementation (Figures 9 and 10 and Appendix 6.7).

By contrast, total personnel cost (remuneration and pensions) increased by 64 percent, substantially below the 94 percent increase of total public expenditure (Appendix 6.7). As a result, the percentage share of personnel cost was reduced from 92 to 78 percent of total public spending during the period. Net of pensions, compensation for teachers and administrators (which includes salaries, allowances, and contribution to future pensions) accounted for under 60 percent of total public expenditure. This is substantially below the personnel expenditure of most lower-middle-income countries.

**Intragovernmental transfer of resources** is the area where the most far-reaching change in education finance has occurred. The Government in 1991 initiated a policy to transfer public funds directly to the regions. In 1990, the MED managed 71 percent of the public education expenditure, the regions 17 percent, the universities 10 percent, other public institutions 1.6 percent, and the PRES 0.3 percent. By 1997, only 25 percent of public expenditure was managed by MED, as 56 percent was transferred directly to regions, 16 percent to the universities, 2 percent to other decentralized public institutions, and nearly 4 percent to the PRES (Figure 11 and Appendix 6.5). Given that such a large share of public expenditure on education is transferred to the regions, the universities, decentralized institutions, and PRES, the case for strengthening coordination among these bodies for policy and resource allocation is even stronger.

The departments can generate their own resources to invest in education, most of which are used to purchase goods and services, for administrative purposes, or for post-secondary education. However, the departments' capacity is limited, and they depend heavily on transfer from the central government (Appendices 6.11 to 6.17). In 1997, central transfer accounted for 100 percent of pensions, almost 100 percent of all salaries in administration, planning, initial education, primary education, secondary education, tertiary education, and special education. PRES provided most of capital expenditure in primary and secondary education in the country.

**Figure 10. Composition of Public Expenditures on Education, 1990 to 1997 (Percentage, Regrouped According to the Lastest Classification)**

Source: Ministry of Economy and Finance (MEF)

**Figure 11. Inter-Governmental Transfer of Resources (Percentage of Total), 1990 to 1997**

Source: Ministry of Economy and Finance (MEF)

17
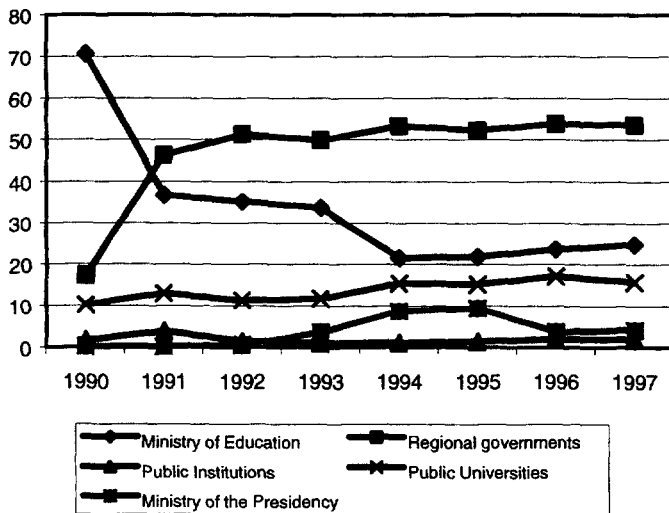

It should be noted that pensions are paid through the department where the retiree resides, not where he/she used to teach. That is why the share of pensions as a proportion of total public expenditure varies from one department to the next. In 1997, pensions accounted for 32 percent of MED's total expenditure, about 21 percent of the region's expenditure, but 14 percent of total university expenditure. Since MED has jurisdiction over Lima/Callao, 43 percent of the total pensions of the education sector were paid out of Lima/Callao, and the rest through other departments. (Appendix 6.8)

**Intrasectoral allocation.** Among various subsectors, public universities are the only one which has benefited from uninterrupted increase in public expenditure (from about 10 to 16 percent) between 1990 and 1997. In 1997, about 6 percent of total public expenditure was spent on initial education, 27 percent on primary education, 19 percent on secondary education, 2 percent on nonuniversity tertiary education, 16 percent on university education, and 21 percent on administration. (Figure 12 and Appendix 6.9).

It should be noted that administration expenditure includes compensation to all principals, school administrators, and inspectors at all levels of education. Disaggregated information on administration is not available to pro-rate it to various educational levels. That makes spending by each level low and administration rather high. For comparison, OECD countries classify the salaries of all administrative personnel as personnel cost, not as administrative cost (Appendices 10.1-10.5).

**Per student spending.** Between 1990 and 1997, per student recurrent public spending steadily increased at all levels. It grew by 70 percent in initial education, 87 percent in primary education, 71 percent in secondary education, 79 percent in tertiary nonuniversity education, and 335 percent in university education. While the percentage increase was impressive, it started from a very low base (Figure 13 and Appendix 6.10). For university education, the very low per student spending in 1990 signaled poor quality. The rapid increase in per student spending throughout the 1990s, however, reflected not only additional public allocation to this subsector, but also reduced enrollment in public universities. Whether increased resources to improve quality of university education should come from the public or private sector will be discussed in Chapter 3.

Converted to US dollars, per student public spending (inclusive of expenditure on pensions) in 1997 was US$175 in initial education, US$201 in primary education, US$260 in secondary education, US$324 in nonuniversity tertiary education, and US$1,255 in university education (Appendix 6.10). The difference in public spending per student between higher education and primary education in Peru was 6 times. Since the distribution of pensions differs by level of education, expenditure net of pension that goes to operating the university system is much higher than the gross figure, whereas expenditure net of pension that goes to basic education is lower than the gross figure. Net of pensions, per student spending on university education was 7 times higher than that of primary education in 1997. Nevertheless, this differential is still lower than that in many countries of Latin America (which may be as high as 20 times). In many countries in the region, public expenditure on higher education per student is often above $2,000.

Source: Ministry of Economy and Finance (MEF)

**Figure 13. Per Student Recurrent Public Expenditure on Education by Level, 1990 to 1997 (Constant 1997 Soles)**

Source: Ministry of Economy and Finance (MEF)

**Equity of distribution of public expenditure.** How equitable has the distribution of public expenditure been? A standard method to measure the incidence of public expenditure is to construct a Lorenz curve[20] to show the proportion of education expenditure which accrues to each consumption or income quintile. (This report uses consumption quintiles throughout).[21] Since capital expenditure varies from year to year, only recurrent expenditure for 1997 was used in the incidence analysis.

Figure 16 shows a number of Lorenz curves with recurrent public expenditure disaggregated by level of education.[22] This analysis included expenditure on pensions. Recurrent public expenditure on preprimary and primary education was skewed toward the lowest consumption quintile (29 percent) and that on higher education was skewed toward the highest consumption quintile because the vast majority of students (47 percent) in higher education were from the top quintile and only 4 percent were from the bottom quintile. (Appendix 4.4a.)

Public expenditure on primary education is equity enhancing not only because of the universal enrollment in primary education, but also because many families in the top two quintiles have opted out of sending their children to public preprimary, primary, and secondary schools, leaving the public system mainly to the less well-off (Appendix 4.2a–4.2d, and 4.3a–4.3d). However, the top quintile is the major user of public universities because children from that group have been better prepared for it and cand afford to forgo the income to pursue further education. That is why public spending on the preuniversity level is more equitable than that on university education.

---

[20] The Lorenz curve is read as follows: the heavy straight black line joining the two corners as shown in Figures 14–16 is the line of "perfect equality" or the line which would obtain if each consumption quintile received an equal amount of educational expenditure—for instance, if 20 percent of expenditures accrued to the poorest quintile just as to the richest quintile. The curved line(s), the Lorenz curve(s) shown in these figures, represent the actual distribution of expenditures. The closer the curves are to the diagonal, the more equitable is the distribution of expenditures—in Figure 14 the curved line is very close to the diagonal, and the claim can be made, subject to certain assumptions, that public education expenditures in Peru are equitable.

[21] The methodology for undertaking this analysis is simple. A table is constructed which shows the enrollments from each quintile, separately for each level of education. The number of students in each of the cells in the table is then multiplied by public expenditure per student on that level. This method is to get around the lack of data on actual expenditure per student by quintile. It assumes that the same amount of public expenditure is spent on a child from a poor family as for a child from a rich family. It does not adjust for the difference in teacher-student ratios in rural and urban areas.

[22] The heavy straight black line in Figure 16 shows the line of equality. This figure indicates that public expenditure for the preprimary and primary levels is not only equitable, it is actually biased towards the poor, so that more public expenditures accrue to the poor than to the rich. The diagram also shows that higher education expenditures are very inequitable, especially for university education. Interestingly, equity does not appear to be too much of a problem for secondary education—the broad dashed line for the Lorenz curve for secondary education falls close to the diagonal.

Figure 14 shows that when recurrent public expenditures per student at all levels were combined, overall recurrent public spending was distributed quite equitably. The three lowest quintiles each received over 21 percent of the recurrent public expenditure on education, while the top quintile received 17 percent (Appendix 4.4a). This curve, which includes pension expenditure, is also referred to as Simulation 1 in Figure 15.

Since the distribution of pensions differs by level of education, Simulation 2 in Figure 15 tested what the Lorenz curve might look like without pension expenditure. The simulation took an average of 26.5 percent of pension expenditure out of preprimary, primary, secondary, and nonuniversity spending per student, and 13.5 percent out of university spending per student (Appendix 4.4b). The curve of Simulation 2 looks less equitable, but is not significantly different from Simulation 1 (Appendix 4.4b). This simulation is closer to the true picture (assuming that similar proportion of teachers are retired from the various groups).

Still, both Simulations 1 and 2 were built on the assumption that the public spending per student in each level of education was uniform across all quintiles.[23] However, the variation of public expenditure per student by department indicates that this assumption is unlikely to hold. In 1997, for example, the average public recurrent expenditure on primary and secondary education per student in the poor Department of Huancavelica was only 40 percent that of the national average, in contrast to richer Moquegua and Tumbes which had a level of per student spending that was about 160 percent of the national average (Appendix 6.18). This variation may be attributable to three reasons: (i) the pension burden (which is included in the expenditure) is much smaller in the poorer, interior department but much heavier in the richer, coastal departments; (ii) the ability to generate their own resources varies between departments; and (iii) since resources are based on student-to-teacher ratios, the freeze of pensionable positions in 1995 put departments with high birth rates at a disadvantage. Whatever the causes might be, the assumption of uniform per student spending is questionable.

Simulation 3, therefore, varied the per student spending by quintile. The simulation held the public spending per student of the middle quintile constant for all levels of education, but reduced that of the second quintile to 15 percent below that of the middle quintile, and that of the first quintile 30 percent below that of the middle quintile. By the same token, per student expenditure of the fourth quintile was raised 15 percent higher than that of the third quintile and the top quintile was 30 percent higher (Appendix 4.4c). Although the choice of these percentages for the simulation already reduced the variation in per student spending in the Departments by more than half, the Lorenz curve of Simulation 3 is still dramatically more unequal.

---

[23] An account of the criticisms and the relevance of studies about the incidence of benefits can be found in "Assessing the Welfare Impacts of Public Spending," by Dominique van de Walle, *World Development*, 1998.

Figure 14. Lorenz Curve for Incidence of Public Expenditure

22

Simulation 4 combined the principles of Simulations 2 and 3 and repeated the same experiment after taking out the pensions. Predictably, the distribution is the worst among all simulations (Figure 15 and Appendix 4.4d).

Simulation 5 asked: if per student public expenditure on higher education was much higher than the current level, while per student spending at all other levels remained the same, how inequitably would public resources be distributed? The Lorenz curve of this simulation is almost as unequal as those in Simulations 3 and 4. This shows that the relatively low public expenditure on university education per student is an important reason for the overall Lorenz curve to look equitable in Simulations 1 and 2 (Figure 15 and Appendix 4.4e). However, if school resources are distributed inequitably across quintiles, no matter how high enrollment ratios are in basic education, the Lorenz curve will look worse.

This exercise shows that the equitable overall showing of the Lorenz curve (Simulations 1 and 2) can be attributable to three reasons: (i) universal primary education benefits the poor more than the better-off; (ii) the better-off have opted out of public schools, thereby consuming less of public subsidies; and (iii) public spending on higher education per student is relatively low. The system could be extremely unequal, if per student allocation in any given educational level is less for lower quintiles than upper quintiles, and if public expenditure allocated to universities continues to escalate.

If capital investment is taken into account, the distribution of public expenditure is likely to be even more inequitable. The negligible historical capital investment has resulted in a highly inadequate learning environment. Historical investment in school infrastructure and equipment tended to favor large urban schools, the argument being to bring the greatest benefit to the largest number of pupils. As a result, urban schools are better endowed than rural schools. In the mid-1990s onwards, the National Social Fund (Fondo Nacional de Compensación y Desarrollo Social or FONCODES in short) which was administered under PRES has responded to the demands of rural communities. INFES is also building schools in rural areas.

**Summary**. The exercises in this chapter found that public resources have been very low, although *relatively* well-targeted and well-used within the overall constraints. The pattern that emerged in the 1990s of a modest but steady increase in public spending on education reflects both commitment to education and fiscal restraint. The Lorenz curve constructed from using uniform per student expenditure for all quintiles suggests equitable distribution of public expenditure, although the absence of actual cost data by quintile leaves lingering questions on the methodology. Future investigation should collect data on the actual amount of public resources spent on students from different quintiles to shed light on this question. Furthermore, the largest increase in per student spending in the 1990s is that on public universities, and yet the majority of students in this level are from upper quintiles. This trend should be monitored closely to ensure that public resources are targeted to the truly disadvantaged. Given that the level of public spending on education is still low in absolute and relative terms, to expand access and improve quality for the poor, additional and targeted investment needs to be sustained for a long time in order to equalize educational opportunity.

## 2.3. Household Expenditure on Education

With respect to the second question of whether Peruvians value education and have invested heavily in the education of their children, the answer is unequivocally affirmative. Historically, communities built schools and organized learning long before the Government began to play a key role in financing or provision of education.

This was borne out by the high level of household spending on education, totaling to about 2 percent of GDP,[24] according to analysis of household surveys of 1994 and 1997. This level of household expenditure is higher than the 1.3 percent of GDP spent by OECD countries, also higher than Argentina's 0.75 percent and Mexico's 1.1 percent, but lower than Chile's 2.6 percent, Colombia's 3.6 percent, and Jamaica's 6 percent.[25] It should be noted that composition of household expenditure on education may vary from country to country. Since household expenditure estimates are obtained from household surveys, how the questionnaires are phrased affect the information obtained. The cross-country information provided above is intended to show the range of household expenditure on education. It should be not be taken as comparable.

The key question is *not* whether households in Peru spend too much or too little but *what this level of spending by households implies for educational policy in Peru*. Understanding the breakdown of expenditures across consumption quintiles would provide an answer to the question of whether certain groups of Peruvians are deprived of educational benefits because they are too poor to afford the necessary expenditure. Secondly, it is important to address the question of what variables determine the variation in expenditures across households—this would aid in understanding the implications for educational development in the future.

**Disparity in household spending on education by quintile**. Figure 17 shows the Lorenz curve for total private expenditure, which looks very dissimilar to the equitable Lorenz curve for total public expenditures in Figure 14, but looks very similar to the very inequitable distribution of expenditure on public universities in Figure 16. The expenditures are indeed inequitable, with the lowest quintile accounting for only about 4 percent of the total household expenditures on education, and the upper quintile as much as 57 percent. This Lorenz curve for all private expenditures does include spending on private schools.

Figure 18 shows the Lorenz curve of household expenditure which is spent only on public schools. However, the curve is only slightly better. Peruvian households spent ap-

---

[24] In 1997, household spending on education amounted to about US$1,300 million (Appendix 7.14). Given Peru's GDP in that year of US$65,221 million, household expenditure on education was about 2 percent of GDP. This was consistent with the findings by Saavedra, Melzi, and Miranda in the analysis of 1994 household survey.

[25] OCED, *Education at a Glance*, 1998; Colombia, Departamento Nacional de Planacion, 1996; Chile, Ministerio de Hacienda and Banco Central, 1998; World Bank, 1999d, *Jamaica: Secondary Education: Improving Quality and Extending Access*, Report No. 19069.

proximately $781 million (41 percent) for the education of children who were enrolled in public schools to complement the public spending on education that was about $1,932 million. These household expenditures include registration fees and contributions to parents' associations (Asociacion de Padres de la Familia or APAFA in short), uniforms, school lunches, and transportation.[26]

Figure 19 shows the Lorenz curve of household expenditure on public primary schools; the situation is only worse in regard to secondary schooling. The level of household expenditure on education varies tremendously by income level—the total amount spent on education by the richest quintile in Peru was 13 times the total amount spent on education by the poorest quintile. (Appendix 7.14.) Even this figure is likely to be underestimated because the household survey questionnaire which provided the data for analysis did not include spending on extra tutoring and other school activities such as field trips.

It is far more difficult for poor families to provide sufficient educational inputs for their children. For example, spending on books accounted for 35 percent of total household expenditure on public primary education for the poorest quintile, but only 11 percent for the richest quintile whose children attend private schools (Appendix 7.2). In the case of primary education, the average out-of-pocket cost for parents of the top quintile to send their children to a public primary school was 194 soles (US$73), or 2.2 times the amount spent by the poorest quintile, which was 88 soles (US$33). The average cost per child in the richest quintile in a private school was 1,645 soles (US$618), amounting to 19 times the average cost spent by households in the poorest quintile on public primary schools (Appendix 7.2).

Since public expenditure covers mostly salaries, household contributions in school fees and to the APAFA are often used by schools for repair and maintenance, educational materials and supplies, and water and electricity. The disparity in the ability of parents to pay, therefore, has contributed to the disparity in school resources. Appendix 4.6 presents the result of a survey of some 400 rural and urban public schools in Lima and Cusco by MED in 1994. It shows that the annual APAFA contribution to very large urban schools (with an average of over 1,600 students) amounted to 11,735 soles, in contrast to only 279 soles of contribution to small rural schools (with an average of 96 students).

This survey confirmed the disparity in school resources among very large, large, medium, and small urban and rural public schools[27] (Appendix 4.6). To cite a few examples, 81 percent of very large urban schools have a library, compared to 26 percent of small rural schools; 82 percent of very large urban schools have brick or cement walls,

---

[26] Unfortunately, the data was recorded on the questionnaire instrument of the household survey in such a way that it is not possible to separate out items such as bus tickets from the direct transfer of resources to schools through items such as APAFA fees.

[27] This was based on the MED's survey in Cusco and Lima conducted in 1994. Although the situation might be different now, it is unlikely to have changed so dramatically that it alters the picture.

compared to only 21 percent of small rural schools; 79 percent of very large urban schools have electricity, compared to 37 percent of small rural schools; and 76 percent of very large urban schools have latrines that work, compared to 32 percent of small rural schools.

Appendix 4.5 also illustrates how the disparity in the ability of parents to pay is translated into inequity in resources of schools attended by children of different quintiles (proxied by water and drainage). Note the high percentage of both public and private schools attended by poor children in the first and second consumption quintiles that lacked either water or drainage or both, in contrast to those schools attended by children in the top quintiles. Poor children attend schools with little resources, be that public or private.

**Elasticity of demand for education**. Notwithstanding the aforementioned fact, Peruvians value education highly and would go to great lengths to make sure that their children have an education. Analysis of the behavioral aspect of household education expenditures (Engel's curves) found that the income elasticity of demand is a low 27 percent (See Background Note 2).[28] This means that *education expenditure is considered to be a necessity by Peruvian households and that there is a strong underlying demand for education, by both rich and poor.*[29]

To make sure that the conclusion was not based just on one pooled set of regressions, the regressions were run separately for subsamples by indigenous and nondigenous, rural and urban, and poor and rich. Consistently, the pattern is that the income elasticities are lower for the more disadvantaged groups. It was 12 percent for the poorest quintile, 14 percent for rural populations, and 10 percent for indigeneous people.

The finding resonated with that of Rodriguez and Abler (1998) for a sample of Peruvian children 6 to 16 years old. They found that even if there is a positive relationship between income of the family and the probability of school attendance, the estimated marginal effects are small. Moreover, the magnitude of the negative effect of family income over participating in the labor force is also small. That is why overall enrollment did not decline, and child labor did not increase, during the time of economic crisis. The study by Gertler and Glewwe (1989) had similar findings: that rural Peruvian households were willing to pay fees high enough to more than cover the operating costs of new secondary schools in their villages. This is even true of the poorest quarter of the income distribution.

---

[28] See Deaton and Case (1988) and Sadoulet and de Janvry (1995). The specification used here also borrows heavily from a Yale University Working Paper by Mwabu (1994), *Household Composition and Expenditures on Human Capital Inputs in Kenya.*

[29] Mwabu's work on Kenya indicated a much higher income elasticity of education expenditures of 73 percent.

27

From the point of view of educational policy, however, the Government cannot rely on general increases in income to bring about greater expenditures on education to improve educational quality for disadvantaged groups. For every doubling of household income, the budget share spent on education would go up only by a quarter on average; for the poor, the rural people, and the indigenous people, their budget share in education would only go up by 10 percent or so. Given that levels of household expenditure on education vary vastly by income level, there is a great need for specific policy instruments that will address the inability of poorer households to incur additional expenditures.

**Conclusion.** Because the burden for financing education is disproportionately heavier for poorer households than richer households, the public sector has a special mandate to ensure the equality of educational opportunity for all by directing more public resources to the poor. Past constraints on public expenditure allow exercising this mandate without exceeding reasonable overall public allocations to the sector.

# 3. System Performance Indicators

This chapter reviews indicators on educational access, internal efficiency, quality, and labor market outcomes in order to address the question of whether expansion of education in the past has come at the expense of quality, and to assess the implications for policy in the future.

## 3.1. Access, Repetition, and Retention

Household surveys have repeatedly found evidence of near universal enrollment in primary education for children between the ages of 6 and 11.[30] This is reflected in very high gross enrollment ratios. Access to early childhood, secondary, and tertiary education, however, varied tremendously by socioeconomic status, gender, and urban or rural location. In general, both males and females between the ages of 12 and 17 in rural areas, irrespective of consumption quintile, are less likely to be in school than their counterparts in urban areas. For the 17 to 25 age group, girls in rural areas definitely have fewer opportunities than boys of the same consumption quintiles in the rural areas or girls in the urban areas. (Appendices 4.1a– 4.1b).

It should be noted that these gross enrollment ratios indicate how many students of all ages are studying at a given level; it encompasses late entrants, under- and over-aged students, repeaters, and adult learners. Gross enrollment ratios, therefore, often exceed 100 percent. Net enrollment ratios, however, indicate what percentage of children of a particular age group are studying in the level designated for that age group. It never exceeds 100 percent and is a more accurate measure of the amount of schooling acquired by the age group. *Where large differences exist between net and gross enrollment ratios, they signal that a large proportion of students are late entrants and repeaters.* It is, therefore, very telling that gross enrollment rates in the rural areas among lower quintiles are higher (over 110 percent) than even their counterparts in the same quintile in urban areas. The gross enrollment of the top quintile in urban areas is under 99 percent, showing that

---

[30] There are two major institutions in Peru that have conducted regular household surveys and which provide databases for analyzing education indicators: INEI, which is under the GOP, and Instituto Cuanto, which is a privately run organization. INEI conducted a school census in 1993 and another one in 1998. Most of the official education statistics including enrollment ratios and average years of schooling are drawn from INEI's data. This report, however, draws from the household survey of 1997 conducted by Instituto Cuanto because its questionnaire is richer and also because the World Bank's other studies (on poverty and labor market) also drew from this dataset. It should be noted that Instituto Cuanto's sample size is much smaller than INEI's, and its sample frame is different. For this reason, indicators on access, repetition, and retention reported in this report are not the same as those reported in government statistics. Nonetheless, the broad picture revealed by data from Instituto Cuanto is similar to those by INEI. Subsequent to this analysis, the Ministry has undertaken other assessments and made the information public. The reader should also refer to information posted in the Ministry's new website: http://www.minedu.gob.pe.

they move through the system rapidly without wasting time in it. (Appendices 4.1a and 4.1b).

*Peru's net enrollment ratios are much lower than the gross ratios*, averaging in the rural areas only 10 percent in initial education, 65 percent in primary education, 28 percent in secondary education, and 4 percent in tertiary education. These are lower than the urban areas' 12 percent in initial education, 71 percent in primary education, 57 percent in secondary education, and 22 percent in tertiary education. Net primary education enrollment differs substantially by income quintile and gender within and between urban and rural areas. The difference was most pronounced at the tertiary level, where, in the rural areas, only 1.6 percent of girls and 2.5 percent of boys of the first quintile enrolled, in contrast to 12 percent of girls and 7 percent of boys in the same quintile in the urban areas. (Appendix 4.1c and 4.1d).

Rural children tend to enter late into the school system because they often have to walk to school. As schools are usually established in population centers, allowing for 1.5 to two hours' walking distance from other settlements, only older children who can endure the journey can go to school. As a result of their late entrants and high absenteeism (due to the need to help their families and to vulnerability to climatic factors), they also tend to have high repetition rates. Research has found a clear association between late entry and high repetition rates on the one hand, and poverty, indigenous language speakers, and uneducated mothers on the other. About 63 percent of Quechua speaking children are over-aged. For children who work in the countryside, 68 percent are over-aged, and the dropout rate among them is as high as 55 percent (Montero, 1996).

Official statistics on repetition[31] and dropout are highly aggregated, without gender or urban and rural breakdown. In the aggregate, 80 percent of a cohort reached Grade 6, while 60 percent of the same cohort reached Grade 11. However, only 40 percent of Grade 6 students and 20 percent of Grade 11 students had not repeated during their course of study. Dropouts spent an average of 6.7 years in the system (Appendix 4.7). To obtain a picture of the differential repetition and dropout rates by the rich and poor, household survey data are used.

The analysis by Saavedra and Felices (1997) of the 1994 Cuanto household survey confirmed the relationship between repetition and income—the percentage of repeaters went from 17 in Lima, to 24 in other urban areas, and rose further to 35 in rural areas. Repetition is also much higher in public schools than in private schools. The study also revealed the relationship between income and status dropout (defined as the proportion of individuals in a cohort that have not finished an educational level and are not enrolled in any educational institution). For those aged 17 to 24, the status dropout rates were 13 percent in Lima, 20 percent in other urban areas, and 54 percent in rural areas.

---

[31] The MED has adopted a policy of automatic promotion in lower grades in primary education since 1998. Therefore, repetition rates are not good indicators of whether students have mastered the requisite skills for a given grade level.

An analysis of Instituto Cuanto's household survey of 1997 found a large disparity in school survival rates[32] between urban and rural areas. Figure 21 shows that although urban and rural children started out the same in the first year of schooling, they rapidly diverged after the Fourth Grade. Figure 23 displays a similar pattern of school survival rates between children from the top and bottom quintiles. In both cases, disadvantaged children (that is, rural and poor) dropped out much earlier.

School survival rates did not differ much by gender (Figure 20) but disparity was significant between children whose mother tongues are indigenous languages, and those who are Spanish speakers (Figure 22). In comparison with the school survival gap between rural and urban areas, the indigenous gap appears to be smaller. However, this may simply reflect the reluctance of people to identify their own mother tongue (which is the variable often used to construct indigenous and nonindigenous populations). That the school survival rates of Spanish-speakers were much lower than those of urban dwellers seems to lend support to the above-mentioned point.

**Conclusion.** High repetition and low retention rates indicate low internal efficiency of the system. This means that children spend time in the system without attaining the education level and mastering the skills commensurate with the number of years of enrollment. This is not only a waste of public and household resources but also has grave consequences for the future employment prospects and lifetime earnings of children. The solution is not to adopt a policy of automatic promotion but to ensure that children learn the skills relevant to the grade-level every year by a range of policy options to be discussed in Chapter 5.

---

[32] The survivor function plots in Figures 20 to 22 are known as "Kaplan-Meier Survivor Functions." They are nonparametric maximum likelihood estimates of the survivor function. (See *The Statistical Analysis of Failure Time Data*, by J.D. Kalbfleisch and R.L. Prentice, John Wiley and Sons, 1980). The survivor function uses information about the years of schooling completed and the current status of enrollment at school. It is the complement of the empirical cumulative distribution function. The Kaplan-Meier plot is not based on any regression model—the figure simply represents a count of people as they leave the educational system compared to the number of people who stay on. The numerator is the number of people who stay on, and the denominator is the number of people who have been in school up to the time. Hence, the plot always begins at a value of 1, since every one stays on at the first instant, and subsequent "steps" on the figure show people leaving. There is one underlying assumption, that if you have left school, you will not enroll again at a later date. This assumption is more valid in some cases than others, but it is a fairly standard one in the literature on educational attainment.

## 3.2. Labor Market Outcomes

The consequence of low internal efficiency will impact on external efficiency (labor market outcomes). This will become even graver in the 21st century as the trend of the 1990s has already shown rapidly increasing wage differentials among workers with various education levels. After falling between 1985 and 1991 during the economic crisis, the premia of all education levels bounced back in recent years after the implementation of structural reform and opening of the Peruvian economy (Saavedra, 1998). The magnitude of decline between 1985 and 1991 was different among workers of different education levels—it was minimal for university educated workers but was almost halved among workers with other levels of education. When the premia bounced back in the 1990s, the increase was also steepest for university graduates.

Figure 24 shows that in urban areas, in 1997, the earnings differentials between workers who had no education and those who had primary education barely recovered to the level of 1985. Improving quality of primary education will provide some real benefit to those who would only have this opportunity to acquire the requisite skills that distinguish them from workers with no education. The premia of secondary education (over that of primary education) has not grown as fast as that of the primary education premia and still has not reached the level of 1985. This might be related to the relatively slow growth of formal sector work, which normally employs secondary school graduates.

## Figure 24. Evolution of Estimated Premia by Educational Level, 1985 to 1997

Source: World Bank Analysis of Household Survey by Instituto Cuanto, 1985, 1991, 1994, 1997

Although the wage differential between nonuniversity tertiary education graduates and secondary school graduates also recovered by 1997, it was only returning to the level of 1985. Only the university premium exceeded the level of 1985. This signals an increasing demand for a higher level of skills in an open economy that is facing growing

34

international competition and technological change. This trend is similar to those in many Latin American economies such as Colombia (Cardenas and Gutierrez, 1997), Costa Rica (Gindling and Robbins, 1995), Chile (Robbins, 1996) and Argentina (Pessino, 1995) where returns to education have also increased after structural reforms.

Rising education premia has implications for policy. If education premia continue to increase, many people will have incentives to pursue further education, even in adult or evening classes. As they attain more education they are likely to climb in the earnings scale. This will probably increase their likelihood of not being poor. If repetition and dropout rates fall, people will have higher levels of education attainment, even if their years of schooling remain unchanged. Given the positive relationship between literacy of parents and school attendance of children, there is an intergenerational positive effect on education. This is the start of a virtuous cycle. In the case of workers that do not improve their skills through education and training, they are less likely to improve their income due to their lower productivity.

In rural areas, Escobal, Saavedra, and Torero (1998), using a sample of rural families in household surveys from 1985 to 1996, found a positive relationship between years of education of the household head and of the other family members and per capita household expenditure. Taking the trend to its logical conclusion, an improvement in the quality of basic education will certainly have effects over the skill structure of the labor force and income distribution.

Table 2 shows private and social rates of return to education in 1997 (See Background Note 3 for methodology and explanation). Returns to primary education for men are very high. This is not inconceivable for this educational level. A paper by Psacharo-poulous shows the rates of 24 percent and 31 percent for Venezuela and Guatemala, respectively. On the other hand, the large difference between males and females might be attributable to the small number of noneducated males *actually working* in urban areas. That they comprised only 2.3 percent of the sample of males might bias the estimate.

### Table 2: Urban Peru: Rates of Return to Public Education, 1997

|  | Female | | Male | |
|---|---|---|---|---|
|  | Private | Social | Private | Social |
| Primary education | 5.9% | 5.1% | 37.8% | 26.3% |
| Secondary education | 10.4% | 7.4% | 7.2% | 6.1% |
| Non-university higher education | 12.1% | 10.4% | 9.4% | 8.2% |
| University higher education | 13.9% | 12.4% | 12.1% | 11.1% |

Source: World Bank analysis of Cuanto's 1997 household survey

Private returns to education increased with the level of education for both men and women (except for primary educated males). This is completely consistent with the trends observed in the labor market all over the world. What is peculiar to Peru is the very small difference between private and social returns to various levels of education (Table 2). This corroborates the point made in Chapter 2 about the low level of public spending on education per student at all levels, because the calculation of social returns used public expenditure to estimate the cost. When the costs are low, the returns would be high. Another feature special to Peru is that social returns to university education were higher than those to other levels of education. Again, this supports the point made in Chapter 2 about public spending on university education per student being much lower than that of other countries.

Both the social and private rates of return to all levels of education, except primary, were higher for women than for men (Table 2). This indicates the profitability for public investment in girls and women's education. Given the very low enrollment ratio of females in higher education in the rural area, and among the lower quintiles, the beneficiaries of these high private returns are urban women from upper quintiles. Since rural women are not likely to have access to such opportunities without specific government intervention, provision of scholarship to rural girls who have a good academic record would yield high benefits to society.

**Conclusion.** The policy implications of these findings are that investment in basic education, both in terms of qualitative improvement and quantitative expansion of secondary education, will have a positive effect on alleviation of poverty, although returns to this level are probably lower because the initial general human capital is low.

The rising private returns to higher education means that children from the upper quintiles who are the dominant consumers of university education, are the main beneficiaries of public investment in this subsector. (See Appendix 4.2a and 4.2b for enrollment in higher education by quintile and Appendices 4.4a, b, c, d, and e for incidence analysis). Although high social rates of return to education justify continuous government investment in this level, the social returns will not remain high if public spending per student in this level keeps on rising. Additional resources needed to improve quality of higher education can come from cost sharing at the university level. Given that students will benefit from a high level of lifetime earnings, it is justifiable to ask them to contribute their fair share to finance their own study. However, increased cost sharing also needs to be supported by student financial assistance such as student loans to ensure that the academically deserving will not be disqualified due to financial constraints.

To ensure gender equity, a proactive policy by the Government is needed to support women, particularly those in the rural areas, with good academic standing to access higher education.

## 3.3. Learning Outcomes

While repetition, retention, and dropout rates are indirect indicators of quality, the most direct measure of learning outcomes is student achievement. Like other Latin American countries, Peru has only set up measures of student achievement in recent years.[33] Notwithstanding startup problems—which are common to many countries, and which limit interpretation of the initial tests—information on the relative performance of students in the country provides the opportunity for a preliminary diagnosis of determinants of achievement. In addition, it provides a basis for improving the assessment instrument and other technical aspects for policy research in future. (See Background Note 4 for description of the analytical procedures and preliminary findings.)

Table 3 presents the national average Grade 4 mathematics test scores and scores of various subgroups of the 1996 assessment. It should be cautioned that such scores are not meaningful by themselves. Furthermore, validity (measuring what it should measure for students at that grade level) and comparability of the instrument across years have yet to be established. An assessment instrument that is set to be too difficult, even if it is based on the curriculum, can have the effect of making students perform badly; on the contrary, if it is too easy, it can make all students perform well.[34] Also, because the test was not equated with other internationally known studies—such as the Third International Math and Science Studies, whose Population A of 9- and 10-year-olds were quite comparable with the Peruvian Fourth Graders—the test results *cannot* be interpreted as an indicator of how well students performed in comparison with students of other countries.

What is informative for policy analysis purposes is the relative performance of students compared among themselves. Table 3 shows that the achievement gap between private and public schools was large. Among public schools, disparity existed between urban and rural areas. The urban and rural outcome differential should be much bigger than the data show, because children in very small rural schools with only a single teacher were not included in the test, and yet these schools represented about 29 percent of all schools and about 6 percent of the population of Fourth Graders.[35] Students on the coast performed on average better than those in the mountains (sierra), who in turn, fared better than those in the jungle (selva). There was also a gender difference in outcomes, as girls did less well than boys. The lowest score was among Quechua-speaking students. To the extent that the coefficient of variability was large on country average, and much larger

---

[33] The first national standardized test of achievement in mathematics and language was conducted in 1996 among nearly 50,000 Fourth Graders in a national sample. Background Note 4 reports the findings of an analysis of determinants of achievement. The assessment program was expand to other grades in 1998 and 2000. However, because the findings from these subsequent exercises were released after the completion of this report, they are beyond the scope of this study.

[34] A good test should have both easy and difficult items for both the average and the exceptional students to score. It should be consistent in its difficulty level from year to year in order to measure progress.

[35] According to the 1993 Census, 29 percent of all schools were single-teacher schools, 33 percent had at least some multigrade classrooms, and 38 percent were complete schools.

among certain subgroups (public rural schools, Quecha-speaking students, and in the jungle areas), variability of learning outcomes is a key issue in education.

**Table 3: Fourth Grade Mathematics Outcomes, 1996**

|  | Average Mathematics Test Scores (Standard Deviation in parenthesis) | Coefficient of Variability |
|---|---|---|
| Countrywide average | 45.4 (21.5) | 0.47 |
| Male | 47.1 (21.7) | 0.46 |
| Female | 43.7 (21.1) | 0.48 |
| Public rural | 38.7 (21.0) | 0.54 |
| Public urban | 44.0 (20.2) | 0.46 |
| Private | 62.4 (21.1) | 0.34 |
| Spanish-speakers | 47.3 (21.6) | 0.46 |
| Quechua-speakers | 33.1 (18.0) | 0.54 |
| Aymara-speakers | 45.0 (20.0) | 0.44 |
| Coast | 49.9 (21.6) | 0.43 |
| Mountain | 45.4 (21.4) | 0.47 |
| Jungle | 37.5 (18.9) | 0.50 |

Source: Ministry of Education.
Note: The coefficient of variability is computed by dividing the value of the standard deviation by the corresponding mean of the group.

To assess the impact of public finance on school achievement, mathematics outcomes by department were regressed on per student public expenditure on primary education by department of 1994. The reason for using 1994 expenditure data to predict learning outcomes in 1996 was because of the time lag between public spending and demonstration of effects on learning. No relationship was found between public spending per student by department and outcomes by department, as the R-square was zero (Figure 25). A weak relationship was also found between poverty by department and per student public expenditure on primary education by department (R-square = 0.06) (Figure 27).

This might be attributable to the formula of allocating teachers: in the rural areas, one teacher is allocated for every 20 students, whereas in the urban areas, one teacher is allocated for every 35 students. Given the high correlation between poverty and rural population as a percentage of total population in the department, it could well be that no relationship was found between poverty and public expenditure per pupil. One should also take into account that the massive increase in public spending on education began only in 1993 through 1995. It is not surprising to see little effect of public spending on outcomes during this short time period because of the natural time lag between delivery of infrastructure, goods, and services (including textbooks) to the schools, and when these facilities and goods are used for teaching and learning.

40

To examine the effects of household expenditure on achievement, family spending on basic education per capita in 1994, by department, was used to predict mathematics outcomes in 1996. It should be noted that the level of household spending on education reflected a very long tradition of family support for education, and hence, the level of private spending was likely to represent a continuity of this tradition, rather than an abrupt change as in public spending.

When mathematics outcomes by department were regressed on household spending on basic education per capita by department, a positive relationship was found and the R-square statistic was a strong 0.38 (Figure 26). This indicates that the higher the level of household spending per capita by department, the higher the learning outcomes by department. This raises the question of whether poorer departments were particularly disadvantaged.

To answer this question, poverty index by department was regressed on household spending on basic education per capita by department. A negative relationship was found, meaning that the poorer the department, the lower the departmental average of household spending per capita. The R-square statistic was a strong 0.54 (Figure 28). These reinforce the points made earlier about the *inherent inequality in relying on households to finance basic education* because this merely replicates the socioeconomic inequality in society.

Nonetheless, some departments which had low levels of household spending on basic education had departmental outcomes well above the predicted line (Figure 26). This raises the issue of whether household expenditure by department captures the effects of other variables. To disentangle these issues at the departmental level, the technique of hierarchical linear modeling (HLM) was used. (See Background Note 4 for details.)

It was found that, although the combination of public and private expenditure per capita by department explained nearly half of the between-department variance in outcomes, public and private expenditure did not substitute for each other. Poverty alone had a negative effect on outcomes, but it did not have a linear relationship with them. Dividing departments into nonpoor, average, poor, and extremely poor categories provided a more precise measure of the effects of poverty on achievement. All of the above-mentioned variables, in combination with departmental percentage of female students, students in private schools, Quechua speaking students, and over-aged students, and the proportion of teachers graduated from universities and teachers trained in ISP, explained 94 percent of the variance in test scores between departments.

Student-level variables (namely, age, gender, mother tongue, the availability and usage of textbooks, student attendance and study habits, and parental roles) cumulatively explained 5 percent of the within-school variance in achievement. School-level variables (namely, geographic factors, availability and usage of textbooks and homework assignments, teachers' characteristics, teachers' role, principals' characteristics, and parental role) cumulatively explained 35 percent of the variance in achievement between schools. (See discussion in Background Note 4 for details.)

When department-level variables were taken into consideration, in addition to student- and school-level variables, about 12 percent of the variance in math achievement was attributable to differences in characteristics between departments. Within departments, 43 percent of the variance in test scores was attributable to characteristics between schools. Within schools, 45 percent of the variance was due to characteristics among students. A between-school variance in achievement above 30 percent is normally considered as an indicator of inequity in learning outcomes. (See Appendices 5.1 and 5.2 for international comparison.)

It should be noted that the relative weights of the above-mentioned variables reflected more the imprecision in constructing the explanatory variables in the questionnaires than the lack of predictive power of these variables. The relatively low percentage of variance explained at the student-level also reflected the absence of some crucial predictors in the dataset, such as parental educational level, hours of study at home and home resources (which could be proxied by measurable materials such as type of dwelling and sanitary facilities, ownership of refrigerator or telephone). Even at the school-level, where explanatory power was higher, information was not collected on school-level resources (which could be proxied by material the school was constructed of, type of sanitary facilities, availability of water, electricity, and library, etc.); government allocation per student in the school; household contribution per student; whether the school is on shift; and student and teacher absenteeism. To inform policy for more precise intervention, it is desirable to collect these variables in the future, as well as to revise the questionnaire. Another limitation to be overcome in future is the appropriate sampling of rural schools, including single-teacher schools in the sample.

Due to these limitations, the results obtained from analysis of determinants of learning outcomes should be viewed as suggestive rather than definitive. That said, the findings are encouraging in indicating potential directions where change could make a difference.

Although there are gaps in mathematics outcomes between gender, region, and private and public schools, *after controlling for a number of explanatory variables the picture has changed.* Students in poor and extremely poor departments performed better than those in nonpoor and average departments, holding other variables constant. Some departments were doing a better job in educating over-aged students. Aymara students performed as well as Spanish speakers. Quechua students could perform as well as others if they were not educated in predominantly Quechua schools, thereby indicating that the problem is not with the students themselves. Teachers who have had longer years of service, and teachers who have had more in-service training, were positively associated with higher student achievement nationwide. Nonavailability of textbooks was negatively associated with mathematics achievement nationwide. Parental expectation for better performance in the relevant subject has been translated into higher student performance nationwide.

Table 4 summarizes the findings of cross-level HLM analysis to indicate which explanatory variables have positive or negative effects on math achievement and whether these effects varied across schools and departments.

| Table 4: Summary of Effects Crossing between Departments, Schools, and Students | | | | | |
|---|---|---|---|---|---|
| | Statistically significant effects (controlling for other variables) | Effects varied across Department | Effects did not vary across Department | Effects varied across schools | Effects did not vary across schools |
| **Between Department** | | | | | |
| Household expenditure per capita | + | | | | |
| Poor departments | + | | | | |
| Extremely poor departments | + | | | | |
| Department % of teachers from ISP | + | | | | |
| | | | | | |
| **Cross-Level between Schools and Departments** | | | | | |
| Female students | - | | x | | |
| Over-aged students | - | x | | | |
| Quechua students | - | x | | | |
| Teachers' years of service | + | | x | | |
| Number of training courses attended | + | | x | | |

**Policy implications.** These findings point to the opportunity for public policy to make a real difference for disadvantaged students. The policy interventions should be universal where the effects have nationwide impact (that is little variation at the school and departmental levels). These include textbook provision (by extending beyond the primary level which was provided by MECEP to preschool and secondary level); strengthening teacher pre-service and in-service training; providing incentives for experienced teacher to remain in the profession; deploying qualified and experienced teachers to the rural areas; specific training to teach more effectively to over-aged students; and

using the mass media and parents associations to enhance parents' role in supporting their children's education. Where the effects vary across departments or schools, targeted interventions are desirable. These include specific support for schools where Quechua-speaking (and other indigenous) people are predominant. This might require strengthening bilingual education and text materials. In better schools, special attention might need to be paid to bring girls and over-aged students up to the standards of other students. Finally, it should be remembered that there was no statistically significant difference in performance between Spanish speakers and Aymara speakers. Future research should find out what factors have enabled the latter to overcome the barriers facing speakers of this indigenous language.

These findings were consistent with those from the literature about the effectiveness of several commonly used policy instruments to improve learning outcomes. These instruments include provision of instructional materials and facilities (such as textbooks, libraries, and laboratories); increasing the opportunity to learn through increasing instructional time and homework; provision of teacher training; increasing teachers' salaries; and reducing class size. Figure 29 summarizes the findings from the literature review.[36]

**Figure 29. Determinants of Effective Learning in Primary Education: Findings from Literature Review**

Percent of Studies Showing Positive Effect

[36] World Bank, 1995; Lockheed and Verspoor, 1991; Harbison and Hanushek, 1992; Postlethwaite and Ross, 1992; Warwick, Reimers, and McGinn, 1989; Tatoo et al., 1990; Fuller and Clarke, 1994.

44

It should be noted that *the effectiveness of these instruments depends on specific country context* and that some measures are administratively simpler to implement (such as provision of a library, or textbooks) than others (such as improving teachers' knowledge). Therefore the graph should not be interpreted as a hierarchy of effective interventions, but rather it should be viewed as an indicator of degree of easiness for implementation. Providing school libraries is found to be cost-effective in nearly 90 percent of the studies, and increasing instructional time (such as lengthening the school day or providing additional instruction in a certain subject) almost equally effective. Asking students to do homework comes third, and provision of textbooks to children who do not have them comes fourth. Improving teachers' knowledge through training is found to be effective in the majority of cases, and having experienced teachers also comes close. Provision of laboratories, increasing teacher salaries, and reducing class size are also effective, but in fewer cases, most probably because they are more difficult to implement.

A more recent review by Schiefelbein, Wolff, and Schiefelbein (1999) on cost-effectiveness of primary education policy in Latin American found six interventions with highest estimated impact on target population if fully implemented. These are: (i) adopting multiple interventions of learning packages, school-based management, training, and testing; (ii) assigning best teachers to the first grade; (iii) decentralizing with supervision; (iv) paying rural teachers 50 percent more; (v) providing standard textbooks and training teachers; (vi) using developmentally oriented preschooling.

Policymakers are well advised to evaluate which interventions are relevant for their country's conditions and to assess the feasibility of implementation and the recurrent cost implications.

**Conclusion.** This chapter aims to address the question of whether expansion of education in the past has come at the expense of quality. A review of indicators on educational access, internal efficiency, and quality has found that there has been a tradeoff between access and quality as resources have been spread thinly to meet multiple demands. In light of rising premia for education, which signal a growing demand for higher skill levels in an increasingly competitive environment, the serious implications for the employment prospects and future lifetime earnings of disadvantaged groups cannot be ignored. This calls for a focus on quality improvement particularly for disadvantaged groups as a centerpiece for education policy.

45

# Chapter 4. The Teaching Profession

The fourth question asks whether the ability to contain personnel cost in public expenditure on education has contributed to Peru's ability to extend educational access and how this and other policies toward teachers might affect the sector. Since education is a labor intensive enterprise because interaction between students and teachers is critical to learning, sound policy toward teachers that can enhance student learning will improve efficiency of resource use. The findings in the analysis of determinants of math achievement in Grade 4 in Peru affirmed the positive impact of teacher qualification, experience, and professional development on achievement nationwide. Research evidence from the United States also found that skilled teachers are the most critical of all schooling inputs (in an environment where the needs for textbooks, instructional materials, and facilities have been met).[37] These findings underscore that focusing on teachers and teaching is the only way in which an education reform can make an impact in the classroom and help improve student achievement. This chapter reviews the issues related to the teaching profession with the aim of identifying options for improvement.

## 4.1. Teacher Qualifications and Employment Status

**Qualifications and deployment.** In the Peruvian public education system, there are some 248,000 primary and secondary school teachers (Appendix 2). About 62 percent of these are qualified with titles (*con títulos*), that is, they have a diploma in pedagogy from one of the 318 tertiary-level teacher training institutes (Instituto Superior Pedagógico or ISP for short) or from one of the 38 education faculties of a university. The rest (38 percent) are unqualified (*sin títulos*), that is, they do not have pedagogical titles. They either did not fully satisfy all requirements for the pedagogic diplomas, have other tertiary-level diplomas, or have only completed secondary education. Teachers without titles have lower pay and lower status than those with titles in the profession (Appendix 6.19).

There are no statistical breakdowns of the academic qualifications of teachers without titles by level of education. The only information comes from the sample survey of teachers that accompanied the 1996 national assessment. Among teachers of Grade 4 students in the sample, 15 percent graduated from university pedagogical programs, 51 percent graduated from ISPs; 1 percent graduated from Institutos Superiores Técnicos (IST); 6 percent held university bachelor's degrees, 17 percent obtained their teaching qualifications through part-time professional studies; 1 percent graduated from other programs; 6 percent had only secondary education plus teacher training; and 3 percent had only secondary education without any training (see Table 2 in Background Note 4).

Having the required pedagogical qualifications is not synonymous with being a good teacher. In fact, ISPs are alleged to be academically weak and also to attract poorly

---

[37] According to Ferguson (1991), in the United States, 49 percent of learning outcomes is attributable to home and family factors (such as parental education, income, language background, ethnicity, and location), whereas 43 percent is attributable to teacher qualifications and experience, and only 8 percent to class size.

prepared students. However, since teachers without titles have lower pay and lower status in the profession, those who remain in the profession signal that they have even lower opportunity cost than the trained teachers. Furthermore, the analysis of the 1996 test confirmed that teachers who were graduates from university and ISPs were associated with higher student achievement than those who were not graduates from these programs.

Although the number of teachers with titles seems low, this already represents a dramatic improvement even from the early 1990s. According to the 1993 census, only 52 percent of teachers in service had titles while 48 percent did not. By 1995, teachers without titles declined to 42 percent. By 1997, they were reduced to 38 percent.[38] At present, to be appointed to an authorized pensionable position, one has to have a title and have passed a nationally competitive examination. The rapid growth in the supply of teachers with titles is due to a dramatic increase in teacher training institutions, particularly the private ones. Background Note 5 discusses the implications of the rapid growth of teacher training institutions and the issues of teacher training.

While progress has been made in the supply of teachers with titles, the key question is whether there is a particular pattern in the deployment of teachers without titles and its potential impact on quality of education. According to the 1993 census, the vast majority (68 percent) of the unqualified teachers taught in the rural areas. The MED's 1994 survey of rural and urban public schools in Lima and Cusco found a positive relationship between school size and the percentage of teachers with titles. In large and very large urban schools, as well as large rural schools, over 81 percent of teachers had titles. In medium-sized urban schools, teachers with titles dropped to 73 percent, while in small rural schools, they declined further to 50 percent. The percentage of teachers trained in regular programs (that is, in ISPs and the education faculties of universities) varied from a high of 85 percent in large and very large urban schools, to 64 percent in small urban schools, to 53 percent in small rural schools (Appendix 4.6).

The same pattern is also observed among principals of schools. For example, over 92 percent of principals in very large and large urban schools, as well as in large rural schools, had titles, compared with only 74 percent in small rural schools. Over 86 percent of principals in these large urban and rural schools were trained in regular programs, in contrast to only 72 percent in small rural schools. (Appendix 4.6.)

These patterns show that teachers who have the required qualifications are reluctant to take up hardship positions in remote rural areas. They still go to large rural schools which are located within reasonable distance from an urban area, and which tend to have better school resources, and easier access to health and other social services for the teacher and his or her family.[39] The same is not true for small rural communities, where the poor working conditions, the lack of opportunities for additional part-time employ-

---

[38] In the Inka Region, for example, unqualified teachers accounted for almost 60 percent of the teaching force in 1990, but now account for only 32 percent.

[39] See the companion Health Sector Study by the World Bank for the inadequate and low quality rural health service (World Bank, 1999b).

ment or work for the teacher's spouse, and inaccessibility to various social services make it hard to attract teachers with titles.

The findings of the 1994 survey of rural and urban schools illustrate just how large a disparity in working conditions exists between urban and rural schools. For example, electricity was available to over 97 percent of large urban schools, 89 percent of medium-sized urban schools, and 55 percent of small urban schools, in contrast to only 29 percent of small rural schools. All teachers of Second Grade who were surveyed in very large urban schools had textbooks, compared to only 91 percent of teachers in small rural schools. The number of visits by an inspector from a USE, no more than 1.5 times per year at best, was twice as frequent in urban schools than in rural schools, reflecting both the difficulty of access as well as marginalization of rural schools. The average number of training courses attended by teachers was much higher for those in urban schools than rural schools (see Appendix 4.6). And yet, there was insignificant earnings differential between teachers who worked in difficult rural conditions and those who taught in urban areas. (See Appendix 6.19.)

That is why the turnover rate of rural teachers is much higher than that of urban teachers. For example, the average year of teaching in the schools surveyed was much shorter (2.3 to 3.6) for teachers in small and medium-sized rural schools than for teachers in very large urban schools (5.9), although their average ages were within a narrow range of 32 to 36. For school principals, taking up postings in smaller schools appeared to be a channel for career advancement. The average age of principals in large urban and rural schools was between 45 and 48, but that of principals in small and medium sized rural schools was between 36 and 39. (Appendix 4.6.)

Policy to address the inequity in learning outcomes cannot avoid tackling the issue of *deployment of trained teachers to rural areas*. This entails providing a larger rural allowance tied to positions in rural schools, and using job rotation every three years to attract teachers with titles to take up positing in remote communities because it will not be a permanent assignment. Meanwhile, public investments should be made in rural schools to improve school resources and working conditions, as well as to enable rural teachers to break their isolation and maintain professional contact with other teachers within a cluster of schools. Teachers who are going to teach in rural schools should be given additional training on how to handle multigrade teaching. Concomitantly, since many remote areas are populated by indigenous people, it makes sense both in terms of promoting multiculturalism and bilingualism to recruit indigenous teachers for schools in their communities. Given the association of indigenous teachers (except the Aymara) with low achievement of students, this indicates indigenous teachers should be given additional pre-service and in-service training in order to prepare them better for the task.

**Employment status.** Teachers are classified either as permanent staff who are appointed to authorized pensionable positions (APP) (knows as *nombrados*), or on contract (known as *contratados*). Contracted teachers are not eligible for pensions, and can be dismissed without severance pay. There is no relationship between teachers' qualification and employment status.

APPs are the main means of allocating public education budgets to lower levels of educational authorities. Theoretically, APPs were distributed to each Regional Directorate of Education on the basis of enrollments in each school (one APP for 35 students in the urban areas and 20 students in the rural areas), and incremental APPs are supposed to be allocated annually on the basis of the changes in enrollment. But the organic APPs have not been reviewed for a long time, and the number of annually adjustable APPs has been fixed since 1995. Therefore, no systematic relationships seem to exist between the number of APPs and enrollment, and the budget allocation system has lost its rationale. Since one APP can be used to hire more than one teacher by converting them into contract or part-time positions,[40] there are no precise statistics as to how many teachers are in the system or how many are permanent or on contract. When a Regional Directorate of Education asks for additional APPs on the basis of incremental enrollments in one school, the MED has no information at hand on the possibility of redistributing the APPs in the same region or in its USEs, taking into account the APPs in nearby schools.

The organic APPs are supposed to be filled by appointed teachers through the competitive selection examination, and the annually adjustable APPs by contracted teachers. But when fewer candidates than positions are selected, the organic positions are filled by contracted teachers as well.[41]

More than half of the contract teachers are estimated to have titles because most of them are recent graduates from ISPs. Of the 93,000 unqualified teachers nationwide, some 80 percent are estimated to be appointed teachers. In other words, it is possible that there is a higher percentage of unqualified teachers in permanent positions than those on contract, although in absolute numbers, they are minorities among permanent staff. The nonexistence of a relationship between qualification and employment status is largely due to historical school expansion and demand for teachers. This is probably a major reason why the determinant of achievement study using the 1996 test data did not find any association between teachers' employment status and student achievement, but it did find a statistically significant positive relationship between teacher qualification and student achievement.

The deployment of appointed and contracted teachers does not display a clear pattern because political considerations also may enter into the decision. For example, in the frontier areas, teachers in remote rural schools are often made permanent staff irrespective of their qualifications. Their job security, status, and satisfaction are considered vital to national security. In remote internal areas, the pattern appears to hold as well. For ex-

---

[40] Nationally selected teachers are appointed by the DRE for a specific school on the basis of teachers' preference, scores, and prior teaching experience. Therefore, there is no room for a school principal or a USE director to select the candidates. (However, a principal can hire contracted teachers with the DRE's approval.)

[41] In the case of the Cusco Subregion in 1997, a total of 13,674 organizational APPs was budgeted. However, at the end of the year, only 12,320 teachers were appointed and the balance was contracted. In addition, 158 teachers were contracted as provided by the budget for annual incremental APPs, which has been fixed since 1995.

ample, the analysis of the 1994 survey of rural and urban schools in Lima and Cusco found that among teachers in small rural schools, 90 percent are permanent staff, even though only 50 percent of them have titles and their average age is about the same as those in large urban and rural schools. By contrast, only 84 percent of teachers in very large and large urban schools are permanent, reflecting largely the fact that 81 percent of them have titles. (Appendix 4.6.)

In the old system, appointed teachers enjoyed generous benefits and life-long tenure (see Footnote 6 in Chapter 1 for the various laws that have regulated pensions). However, the pension benefits are rapidly eroded for new entrants. The new individualized private pension system would enable even contracted teachers to contribute to their retirement benefits. At the same time, the institution of performance review in the public sector may soon erode the job security of appointed teachers as well. Nonetheless, appointed teachers would be entitled to severance pay while contracted teachers will not. Given the rapid erosion of job security even for appointed teachers, the major difference between these two types of teacher may be the status conferred. This difference, however, could have a very negative impact on the *morale and commitment* of contracted teachers. Therefore, it is important for policy to address the issue of *incentives* for higher performance. An option is to convert everyone into an open-ended contract with personalized pension plan. This could eliminate the two-tier system and allow performance to determine duration of tenure.[42] This may require a Congressional decision to change the law.

## 4.2. Conditions of Service and Compensation

The differences are minimal in the conditions of service and compensation of appointed and contracted teachers; they are also minimal between primary and secondary school teachers, and between teachers with titles and teachers who have academic degrees in other professions or postgraduate degrees. This indicates a lack of incentives in the system to encourage commitment, professional development, and higher performance, which could translate into better student achievement.

**Conditions of service.** Both appointed and contracted teachers are obligated to work for 40, 30, or 24 hours per week, but that distinction is largely artificial. Most teachers work about the same number of hours whether they were appointed to do it or not. The difference in pay between 40, 30, and 24 hours of weekly work is also minimal. There is also no difference between appointed and contracted teachers in working hours. The majority of initial and primary education teachers are appointed for 30 hours, and secondary teachers for either 30 or 40 hours. There is no difference in pay between primary and secondary school teachers even though the latter are expected to have higher knowledge of subject content. Principals, deputy principals of all schools, and senior teachers at secondary schools are appointed for 40 hours a week. Teachers have the right to ask for reassignment to a different school in a different location after three years of

---

[42] This is the option chosen by the World Bank for its staff in 1998 in order to address the inequity of the two-tier system of having pensionable staff and consultants doing the same job but with different compensation.

51

service, but in reality, it is hard to get reassignment, leading to a lot of dissatisfaction among teachers.

Teachers' working conditions have not changed much over time. They usually have two months of vacation in the summer (January and February) and one week vacation in the winter. In remote rural areas, teachers do come to the town to collect their pay checks if they do not have a bank account and to take in-service training.[43] On those occasions, they often take off a few days informally. Absenteeism is therefore often higher in rural and public schools than in urban and private schools. The academic year starts on April 1 and ends on December 15, but the net instructional period is often less than 180 days, as in many countries in Latin America, which is on the low side of the international range. There is also no difference in remuneration between appointed and contracted teachers.

**Remuneration.**[44] There is only one national salary scale for all regions and departments (Appendix 6.19). Teachers under different pension schemes (governed by Laws 20530, 19990, and individualized accounts) have different salary structures. Those under Law 20530, who enjoy the most generous pension benefits, have lower salaries, whereas those under the individualized pension scheme have the highest salaries. The basic salaries are adjusted for marital status (unmarried or married with up to 5 family members), rural allowance (s/45 per month, which has not changed since 1993), and three fixed bonuses (s/300 each in March, July, and December). The average salary for those under Law 20530 is 627 soles per month, those under Law 19990 receive 646 soles, and those under the individualized pension plan receive 689 soles. Rural allowance, however, is portable; that is, even after teachers leave the rural position and teach in the city, they will still be able to keep the monthly rural allowance permanently. This practice should be discontinued. Reform in salary scale should raise the rural allowance, but link it to the position and not to the person.

There are five scales of salaries (I to V) for promotion. However, the difference between scales is insignificant (only some s/.12 per month). There is only a 10 percent difference in remuneration between the top grade for 40 hours work and the lowest grade for the same amount of work (Appendix 6.19). Promotion between scales has been frozen since 1991. Consequently, the majority of teachers are at levels I and II, and do not have strong motivation for better performance, professional development, and promotion. Ap-

---

[43] To give an example, in Loreto Department, a teacher who has to work in a remote community near the frontier with Ecuador has to travel 20 days upstream by boat from Iquitos to his/her posting and about the same number of days downstream to Iquitos. He/she usually has a few months' advance salary, and picks up his/her pay check in Iquitos three times a year. This means 120 travel days every year. During the teachers' travel to Iquitos, students would not have classes. Even though some of the travel time coincides with vacation days, a significant amount of time is lost. This again accounts for why the learning outcomes of rural children are lower than that of urban students.

[44] Teachers' salaries have been increased by about 16 percent on average since April 1999. However, this report only refers to the salary scale prior to April 1999 because the latest information was made available too late to include in the analysis.

pointed teachers receive their salaries through a bank account, and contracted teachers by checks issued to them.

The salaries for teachers without titles have also five scales (A to E) depending on their qualifications, but the difference among scales is more insignificant than among teachers with titles (Appendix 6.19). A is for those who completed pedagogic studies but have not earned the title yet. B is for those who have completed higher education studies with professional titles in other than pedagogy. C is for those who have not completed pedagogic studies at higher education level. D is for those who have studied at higher education level without any university titles. Finally, E is for those who have only secondary level education. The salary differential between a teacher without title who works for 40 hours and is in A scale and his/her counterpart in E scale is only 39 soles per month.

The salary differential between teachers with titles and those without is more substantial, ranging from 80 soles to 170 soles per month. However, the emphasis on pedagogical titles at the expense of downgrading those who have other higher education degrees (scale B) discourages talent from other fields from entering teaching.

There are no statistics on the qualifications, conditions of service, and remuneration of private school teachers. Given the uneven conditions and quality of private schools, it is likely that teachers' salaries also vary a lot. Those private schools that serve the poor are most likely to pay teachers on an hourly basis (about 5 to 7 soles per hour), and teachers probably have to have two jobs at the same time in order to make ends meet. However, according to the preliminary results of a 1997 survey of 1,000 private and public school teachers, salaries in the top private schools may be as high as 4,000 soles per month (Saavedra and Díaz, 1999).

Teachers' average monthly salary of 646–689 soles is more than twice the minimum wage. This amounts to an average annual salary of about US$2,903-3097, or 1.5-1.6 times the GDP per capita, which is lower than the 2 to 4 times prevalent in other countries at a similar level of development. *This is one of the reasons why Peru has been able to provide such broad education coverage at such a low level of public expenditure.*

Teachers' salaries took a hard hit in the 1980s, but their remuneration in real terms steadily recovered in the 1990s (Figure 30). The key policy questions are not whether salaries were high or low relative to other countries, or whether the purchasing power has recovered, but (i) how teachers' salaries fare relative to other professionals who have similar years of tertiary education, which would impact on the ability of the sector to attract and retain academically capable individuals; (ii) whether the salary structure provides incentives for teachers to take up hardship posts in rural areas, to continue to develop their professional skills, and to improve student learning; and (iii) what the recurrent cost implications for restructuring the salary scale are.

Source: Ministry of Education

Saavedra and Díaz (1999)[45] found that teachers' relative position eroded by 30 percent between 1986 and 1992, but other professionals' relative earnings declined by 16 percent between 1992 and 1996, so that for the whole decade 1986 to 1996 teachers' earnings deteriorated by 10 percent in comparison with other professionals. This salary differential between teaching and other professions could induce the best and most adaptable teachers to leave the profession to take up jobs in other sectors. The data compiled by INEI show that real salaries of all sectors declined sharply between 1970 and 1990, but made some recovery in the 1990s. Average teacher salaries lost more than the private sector as a whole, but fared much better than the administrative staff of the public sector in general and nurses.[46] This has not even taken into consideration the two months' vacation enjoyed by teachers, which is not available to other employees in public or private sectors. In summary, although teachers salaries lost markedly their real purchasing power in the 1980s in comparison with the private sector, they gradually recovered after 1990 and fared better than the public sector as a whole. Nonetheless, better salaries in the pri-

---

[45] Saavedra and Díaz compared the earnings of teachers and other professionals with university-level education, using panel data from the household surveys done in 1986, 1992, and 1996. The work is in draft.

[46] The current mission's findings partly modify the conclusion of Psacharopoulos's 1996 study using household survey data during the 1980s; that is, that teachers are not underpaid in comparison with all other occupations. In fact, teachers are underpaid in comparison with the private sector workers, but not with the public sector workers. The current mission findings also modify the conclusion of the November 1994 Staff Appraisal Report on the Primary Education Quality Project, which states that teachers have suffered the worst fall in income among all categories of government employees. In fact, teachers were better off among all government employees in terms of falls in remuneration.

vate sector could induce migration of the more competent teachers to other sectors. (Figures 31-34.)

The unattractiveness of teaching is particularly serious for secondary education, where growth is expected to occur. The lack of salary differentials between primary and secondary school teachers does not reward knowledge of subject matter, which is more intense in secondary education than primary education. Furthermore, the current salary scale that rewards teachers with pedagogical titles more than those with other degrees (such as in arts and science or with postgraduate training) would not attract talent from other fields into the profession. In the short run, reforming teachers' salary scales to make remuneration to teachers with bachelor or masters degrees in nonpedagogical fields on a par with those with pedagogical titles will be the first step to widen the pool of talent in teaching. This will, of course, have implications for the type of training provided by ISPs, and the basic requirements for teaching. In the long run, the option should be considered of requiring all secondary school teachers teaching above Grade 7 to have the first degree in a subject area, and have additional pedagogical training. The salaries of these teachers would reflect this better academic preparation.

55

## 4.3. Incentives and Accountability

Many countries in the world, including OECD countries and in Latin America,[47] are pursuing education reform in order to meet the challenges of global economic integration and technological changes of the $21^{st}$ century. What distinguishes reform of the 1990s from those in previous decades is the focus on learning outcomes. In varying degrees and at different paces, reforming countries are embracing a set of principles to overhaul their education systems. These are the needs to set standards for student learning, to set standards for teaching, to improve teacher education and professional development, to provide incentives for teacher knowledge and skill upgrading, and to encourage schools to organize for learning. The broad scope of the changes entailed makes this wave of reform one of the most ambitious in the history of education.

In Peru, MED is in the process of building up a meritocratic-based education sector with some of the elements for accountability being set in place. For example, the first national assessment test was implemented in 1996 (Background Note 4); a plan to modernize teacher pre-service and in-service training in primary education was also piloted in 1996 (Background Note 5); and a national competitive examination was introduced to select teachers for appointed teacher positions in 1997. The examination has the dual purposes of selection and quality assurance. Its setup was timely, given the rapid growth of private ISPs, and the diverse curricula offered by ISPs and the education faculty of universities.

In the first administration of the exam, some 96,000 qualified teachers applied for the 34,000 appointed teacher positions, but only 12,000 candidates or 12.5 percent passed the exam. The results of the second examination are very similar to the first one. Since the examination is not a criterion reference test and the validity of the test has yet to be established, it is premature to judge whether the low pass rate reflects poor preparation of teachers or an administrative decision. To truly test the skills of teachers, there is room for modification.

While Peru is heading in the right direction to pursue a systemic reform, it is necessary to ensure that a few key building blocks are in place.[48] Specifically, what needs to be done is as follows:

---

[47] In the 1990s, Latin American countries have devoted considerable financial and human resources to reform the education sector. However, the recent experience of implementation of educational reforms throughout the region suggests that these programs have not been able to transform substantially and extensively the behaviors of teachers, the main actors, in the school level where it matters most. The Second Summit of the Americas held in Santiago, Chile, in 1998 outlined a Plan of Action committing all countries of the hemisphere to new reform efforts, including an increase in the level of professionalism among teachers that combines pre-service and in-service training, and the development of incentive mechanisms tied to updating their skills.

[48] In the United States, 5 years of work has gone into improving the instruments that are making it possible today to pay teachers for what they know and do.

- **Establishing overall goals and standards for students, and assessment of outcomes.** As a first step, the education system has to have a clear set of goals spelled out in detail about what it expects students to know and be able to do. Standards are not the same as curriculum because the latter is usually very content- and topic-specific. Standards are more about skills and competency that could be developed in the course of learning various subjects. Without standards for students, it is impossible to set standards for teachers or to measure whether the goals have been achieved. To be able to measure outcomes, an assessment system must be in place, and test validity and reliability must be secured. The results of the assessment should be fed back not only to policymakers, but also to various levels of administrators, teachers, and parents so that they have a clear sense about their school's relative performance, and can gauge their value-added efforts. Peru might want to start with standard setting and provide the results of the 1996 assessment at least to Regional Education Directorates.

- **Setting standards for teachers.** It is important to spell out the content teachers need to know, and the specific kinds of skills and behaviors that constitute good teaching need to be spelled out in meaningful detail. This means providing written documents on what excellence in teaching in a given subject and in a given level (such as science teaching in primary education) would be. Teachers would be assessed against these standards. This might be the next step for MED.

- **Aligning pre-service and in-service training programs with these standards.** Virtually no country in the world has been able to do this yet. However, steady progress has been made. The development of meaningful teacher standards (such as PRAXIS and INTASC in the United States) is beginning to make an impact. Peru can shorten its development time by building on these materials, and by adding what is relevant for their conditions.

- **Making teacher assessments.** Often, this begins with the use of paper and pencil examinations to test teachers' knowledge of subject content, or for certification of teachers. This process has begun in Peru. However, even with the most carefully designed test items, this form of examination alone is inadequate to assess a broad range of skills (such as classroom management, pedagogical repertoire, and team work with other teachers) needed in order to be an effective teacher. New innovative instruments being experimented with in OECD countries include peer examinations of a portfolio of the teacher's work, videotapes of his/her teaching, interviews, competency tests, and other means to ensure a truly comprehensive assessment of a teacher's demonstrated competence as well as knowledge base. Such assessment is predictably expensive, but probably will be cost-effective in the long run when it can positively affect student learning. Assessment techniques are the vehicle to measure progress and inform any corrections which should be made by the teacher and/or system. In future, Peru may want to start by modifying the methods of recruiting teachers to fill APPs by requiring candidates who perform well in the competency test to demonstrate classroom teaching to determine suitability for teaching. Similarly, the recruitment of

principals should be made beyond a paper-and-pencil test by having candidates visit schools and recommend plans for school improvement.[49]

- **Rewarding teachers' knowledge and skills individually and schools collectively.** How the incentive in the system is structured affects behaviors of teachers. Teachers should be rewarded for what they know and do—as measured by objective and multi-faceted performance assessments—rather than for how long they have been in service. Promotion from one level to the next should be based on demonstrated higher level of competency, not seniority. This could provide incentives for teachers to invest in their professional development, which is not necessarily restricted to in-service training, but could include doing more reading at home, more reflection on their practice, or networking with other teachers to keep abreast of the latest developments in the profession. The results to be measured need not be restricted to student achievement, either, but could be extended to broader student intellectual, artistic, athletic, and moral development, and parent involvement. Whatever it is, it must be measurable, preferably in a value-added way. This is not easy, and that is why, despite the desirability of including more diverse measures, most school reward systems in countries that implement them are basically driven by student achievement tests. At the same time, there should be *rewards to schools collectively in order to encourage collaboration among teachers*. Rewarding schools may not require more than one to two percent of the total education budget. This should be combined with public recognition of excellence. The amount should motivate teachers at the margin, but not be so central that teachers will focus their work exclusively on "the test" or whatever else is being measured.[50]

Building professionalism among teachers could be the center piece of reform, and standards should drive the change in each stage of professional development. The best way to build teacher professionalism is through the work of groups of teachers reflecting on what constitutes excellence in the practice of teaching. Since some countries have pioneered the work, Peru can benefit from their experience without having to reinvent the wheel. It should be acknowledged, however, that this requires changing institutions and culture and will be the most difficult task to accomplish.

---

[49] In New York City's District Two, which has attained national fame for being able to improve overall student achievement and reduce the variability of learning outcomes of an entire cohort, candidates for principal positions are asked to visit a school or watch a video tape of a school and then tell the hiring committee what problems they have identified and what solution they would propose. This would ensure that the principals selected have practical experience of running a school and of providing instructional leadership.

[50] Colombia has introduced an innovative incentive system to reward and recognize good teaching. Students and parents in every school are asked to elect their best teacher based on a set of criteria provided by the Ministry of Education, while every municipality will elect the best schools, again based on provided criteria. Then the departments will elect the best schools from the list, based on the relative positions of the schools selected by the lower levels. The criteria focuses on efforts, rather than existing conditions. Then there are awards for the best schools in the nation, the best schools in the departments and municipalities, and the best teachers. Both teachers and schools would receive public recognition and a cash award.

**Summary.** The answer to the fourth research question is affirmative. However, this introduces a policy dilemma towards teachers. Because of the enormous recurrent cost financing implications, education ministries in the world are often constrained by what they can do about salaries across the board, particularly in view of the consensus on working to extend access to basic education. Yet it is important to provide incentives to attract and retain competent people in the profession because teachers are critical to qualitative improvement, as well as quantitative expansion of the system. The issues that need to be addressed in Peru are (i) the disparity in qualifications between rural and urban teachers; (ii) the lack of reward for subject matter knowledge, particularly in secondary school teaching, and the disincentive in the salary scale and promotion criteria for those who have had university and postgraduate education in fields other than pedagogy to enter and remain in the teaching profession; (iii) the morale problem related to different statuses of employment between appointed and contracted teachers; and (iv) the lack of incentives for higher performance.

The first issue calls for increasing the salary differential between rural and urban teachers to compensate the rural teachers for hardship positions, combined with a job rotation system so that they have an opportunity to return after a few years, with investment in rural school inputs to make teaching there more attractive, and with recruitment of indigenous teachers into teaching in their communities. The recent literature review on cost effective interventions in primary education in Latin America by Schiefelbein, Wolff, and Schiefelbein (1999) found that 50 percent increase in salaries of rural teadchers was associated with an increase in test scores by 19 percent. The second issue calls for (a) in the short run making the salary scale of teachers who teach in secondary education higher than those who teach in primary schools, and also raising the salaries of teachers who have university degrees in other subject areas at least to a par with teachers with pedagogical titles so that they do not have a second-class status as teachers without titles; and (b) in the long run changing the academic requirement for secondary school teachers with stronger emphasis on subject matter knowledge. The third issue calls for unifying a two-tier employment status. The fourth issue really requires the support of a systemic reform geared to establishing an accountability system that rewards group and individual performance, preferably based on value-added efforts. This last will be a long-term endeavor and can only be done when the assessment tools are perfected and a culture of evaluation is accepted.

# Chapter 5. Second-Generation Reform

This report began by posing a puzzle as a guide to its inquiry of why Peru has been able to have high education participation rates with a relatively low level of public spending on education. After reviewing the issues in the sector, the report found that progress made in Peruvian education is attributable to relatively equitable public expenditure that focuses on basic education; the ability to contain salary cost in the sector; and high value attached to education by Peruvian households and their high level of spending on education. However, expanding access under extreme resource constraints has come at the expense of quality.

The large gap in school survival rates between the rich and poor, and the rural and urban population; the large between-school variance in student achievement; and the rising returns to higher levels of education signal that further policy changes can make a real difference, particularly to disadvantaged students. These changes may be loosely considered to be the second wave of reform because they will build on the foundation laid by the first-generation reform that rationalized the public sector, balanced the budget, and mobilized private resources. These changes would help realize the country's aspiration of having a highly educated citizenry to meet the challenges of the 21$^{st}$ century. (Table 5 discusses the implications of the first generation of reform. Table 6 summarizes the objectives, issues, and suggested measures for the second wave of reform).

Peru thus find itself at a crossroads with respect to education policy. The current situation, which partially reflects the success of the first generation of reform, represents important accomplishments. That path could be continued. A second generation of reform, however, would take a path of focussed commitment to improving education as a more central goal in itself and means for accelerating growth and reducing poverty. The following paragraphs summarize this report's conclusions concerning the potential, the content, and the cost of second generation of reform.

## 5.1. Improve Equity

Although public expenditure on education on the whole has been distributed relatively equitably, poor households still have a disproportionately heavier financial burden than rich households for their children's education. The disparity in household spending has led to inequitable learning outcomes. The indigenous people are among the poorest in the country. To equalize opportunity, resources have to *target* the disadvantaged groups.

The options include a range of supply- and demand-side measures. On the supply side, the Ministry should extend the provision of a class set of textbooks to all levels of secondary education and supply an additional class set of enrichment reading materials throughout basic education. Given the major difference made by textbooks (as revealed in the 1996 test), this should be the first priority. Since the Ministry is already experienced in the development and provision of textbooks to primary education through the

MECEP project, it is both easy and logical for it to extend them downward to cover pre-school and upward to cover secondary education. Since this intervention does not involve changing the administrative or finance structure, it is feasible and achievable. This might raise achievement and help retain more children in the system. Meanwhile, the Ministry should also explore the feasibility of providing cost-effective educational technology such as interactive radio to supplement classroom teaching, or audio materials to assist second-language acquisition to support multigrade teaching.

A number of countries in the world have experience with using interactive radio to reach rural communities. Some of experiences have been properly evaluated and found to be highly cost-effective when children are tested for what they learn in comparison with those who are in traditional classrooms. Given Peru's difficult terrain, radio sets can be given to families who have school-age children but live in remote communities. An estimated 6 percent of total students are in single-teacher schools in remote communities. Although radio broadcasts can be used for school instruction, the best use of this medium is during adverse conditions, such as rain, snow, and flood, when children who cannot travel to school can stay home and still learn the lesson. When this is done in combination with programmed text, this will help them overcome the problem of their own and their teacher's absenteeism. Parenting education can also be broadcast by radio so that parents get more involved with their children's education.

Specifically helpful to indigenous children is the expansion of bilingual and multi-cultural education through strengthening teacher training programs in these areas, as well as in multigrade teaching, and recruitment of indigenous teachers to these programs through affirmative action and scholarship. Arregui, Hunt, and Díaz (1996) found that the vast majority of teachers are employed in the department they were trained in. Therefore, ISPs in departments heavily populated by indigenous people should offer bilingual and multicultural programs that are tailored to the groups within their jurisdiction. At present, offerings in these programs in ISPs are extremely limited. To seriously improve the learning outcomes of indigenous children, the central government should support such programs through its allocation of resources. Also, given the findings from the 1996 test that showed a relationship between indigenous teachers, except Aymara, and lower student test scores, it signals that indigenous teachers need better preparation during their training. Therefore, not only should there be bilingual education teacher training programs, but there should also be some form of compensatory education in ISPs to assist indigenous trainees whose performance might be weaker than average.

The training of indigenous teachers needs to be complemented by the provision of bilingual textbooks and educational materials including interactive radio or audio and video tapes throughout primary education. Currently, the resources that have gone into these programs are negligible, and that is why the impact has yet to be demonstrated. Other countries that have adopted bilingual education, such as Guatemala, have positive results. It is worth examining the approaches in these countries in order to improve on them. Given that Peru has many indigenous groups who speak different languages, and that indigenous communities in the Amazon regions are small and dispersed, such intervention is predictably expensive. Nonetheless, given the cost of marginalizing indigenous

people, the benefit of poverty alleviation and social cohesion is high. Although it is unrealistic to develop bilingual texts for all groups within a few years, this should be a long-term project, with targets to be met within a medium term time frame of, say, a decade. Training of teachers for rural schools should also emphasize multigrade teaching. Again, this should be complemented by the provision of program materials.

The Government is already planning to provide distance learning through educational television to enable children in remote areas or out-of-school children access to secondary education. While this is a commendable move, it should be noted that a range of support measures, such as face-to-face tutorials, needs to be put in place in order for distance education to work. Otherwise, dropout rates could be very high.

To ensure that *all children* learn the requisite skills, formative and summative assessment could be used more systematically and frequently. Those students who are falling behind should be provided remedial education during the school year as well as during holidays. The Ministry has adopted an automatic promotion policy from Grade 1 to Grade 2 in order to improve the promotion rates and reduce dropout rates. The impact of this measure on learning outcomes should be evaluated. Given that automatic promotion policy has been associated with failure for students to acquire the requisite skills in many countries, timely compensatory education might be a more cost-effective intervention in the long run. This might benefit particularly disadvantaged children.

Another important issue is poor nutrition and health of children in poverty which has contributed to under achievement in many countries. Although this study on education has not devoted much discussion on the topic, the companion World Bank study on health has examined the issue (World Bank, 1999b). Addressing the health of school-age children either through services provided directly through the schools, or through targeted publicly financed insurance such as the on-going *Seguro Escolar,* would improve attendance and learning. At the same time, it is desirable to consider targeted expansion of the school feeding program (such as *Desayunos Escolares*), given initial positive findings of favorable outcomes with respect to nutrition, health, and attendance (Pollitt, Jacoby, and Cueto, 1996). Expansion of the school feeding program would need to be weighed against typically high costs of such programs, as well as the feasibility of reaching schools in remote areas. Obviously, such multisectoral interventions require a much more coordinated approach between ministries such as MINSA, PROMUDEH, and PRES.

Demand-side financing measures such as scholarships and grants for indigenous or poor children should be explored to enable them to defray the direct costs of education. The mechanism for distributing such scholarships or grants needs to be worked out carefully to prevent abuse. An indirect mechanism is to give schools that have an indigenous enrollment exceeding a certain percentage an additional per student instructional grant based on attendance. The money could be used by the school for purchase of instructional materials, to provide compensatory education, or to subsidize students' clothing or transportation costs.

## 5.2. Enhance Quality

A key measure of qualitative improvement is reduction in variance in student achievement. The 1996 test shows that textbook availability and usage, homework assignments, the characteristics and roles of teachers and principals, and parental role and expectations can reduce between-school differences in learning outcomes. Besides the interventions through textbook provision and teacher training, educating parents about good child-rearing practices and the positive effects on achievement of school attendance, after school studies, and parental involvement in their children's learning by means of the mass media could also help to improve learning outcomes. The policy of universalizing early childhood education to enhance students' school readiness might help reduce late entry and repetition and reduce the between-student differences. Grants for compensatory education or to defray the direct private cost of education to facilitate attendance of indigenous students and girls, who tended to have lower average math scores, may also make a difference.

These interventions could only have maximum impact if they are accompanied by systemic reform that focuses on standards. The necessary components include (i) setting standards for student learning, (ii) setting standards for teaching, (iii) strengthening teacher education and professional development, (iv) providing incentives for teacher knowledge and skill upgrading, and (v) encouraging schools to organize for learning. In other words, making the career of the teaching force more like that of other professions should be the center piece of reform, and standards should drive the change in each stage of professional development. Part and parcel of this reform is to make available indicators on performance by school (test scores; repetition, promotion, and dropout rates by grade) available not only to the DREs, USEs, schools, and teachers, but also to parents, students, and the public. This will allow the families and public to benchmark the schools' performance against other schools. This will generate pressure for improvement, and will also build the groundwork to set up an accountability system.

At the same time, studies on determinants of student achievement at all levels of education could be used to decide what qualifications should be required of teachers and at what level of education. This kind of study would be very similar to the one reported in Background Note 4. If teachers graduated from universities and from ISPs are found to be associated with higher student achievement even at Grade 4 levels, relative to teachers who entered the profession through a different ladder, then it is very important to ensure that teachers are appropriately qualified. To ensure that qualification matches all the requisite competencies to be a teacher of a given grade and subject, teacher pre-service and in-service training should be examined closely and reformed to ensure high standards.

The broader issues that need to be addressed are: (i) the disparity in qualifications between rural and urban teachers; (ii) weakness in subject matter knowledge of teachers, particularly in secondary education; (iii) the morale problem related to different status of employment between appointed and contracted teachers; and (iv) the lack of incentives for higher performance. The first issue justifies increasing the salaries of rural teachers to compensate them for hardship positions, combined with a job rotation system so that they have an opportunity to return after a few years, with investment in rural school inputs to

make teaching there more attractive, and with stepped up efforts to recruit indigenous teachers into teaching in their communities. The second issue calls in the short run for raising the salary scale of teachers without title but who have university degrees in other disciplines to the same level as teachers with titles in order to enlarge the pool of teachers with stronger subject matter knowledge. In the long run, it requires changing the academic requirements of secondary school teachers and reforming ISP curricula. The third issue calls for unifying a two-tier employment status to make open-ended contracts, with the tenure determined by evaluated performance. The fourth issue really requires the support of a systemic reform geared to establishing an accountability system that rewards group and individual performance, preferably based on value-added efforts.

Given that data on teachers are not available, it would be useful to conduct a census of teachers, as part of the school census to be mentioned below, to review their age, qualifications and specialized areas, experience, subjects taught, and various types of compensation received. This would provide data that could serve as the basis of a review of the supply and demand for teachers and the financial implications of increasing the salary differentials between urban and rural teachers, tying promotions to demonstrated competency, and providing monetary incentives to reward schools. Concomitantly, it is necessary to review the legal framework and incentives for teachers in private and public schools so as to provide a benchmark for improvement. Inevitably, the policy towards teachers and their pre-service and in-service training will make a lasting difference in quality.

These measures require institutional and cultural change, which take time. Consensus with stakeholders (namely, teachers) needs to be reached in order for the reform to take root. Therefore, as technical measures need to be put in place (such as spelling out teaching standards for each subject and grade, evaluation tools, and assessment of fiscal impact of changing salary structures), consensus building process should be set into motion by reaching out to teachers, NGOs, and the business community.

## 5.3. Improve Efficiency of Resource Use

The review of public expenditure in this report has only been able to access data down to the departmental level, but not to the USE level. Hence, the report was unable to evaluate the actual unit cost by level and by urban and rural areas, across departments. Even the MEF does not have the expenditure data; it only has the budget figures. To piece together a complete picture of the nation's public spending pattern, particularly to evaluate the equity and efficiency of resource use, in order to adjust policy, it is of utmost importance that monitoring continues to take place to cover the following areas.

- *The trend of public spending on education over time gross and net of pension.* It would be desirable to update and extend the analysis of public expenditure on education to cover not only school-related expenditure, but also education-related subsidies to households (such as school health programs financed by the Ministry of Health, school feeding programs under the PRES), as well as other education-related expenditures under PROMUDEH (such as early child care and literacy programs).

65

- *Differential spending by urban and rural areas at the USE level.* This is equally important so that interventions can be designed to equalize the resources allocated to different schools. This should take into account departments' own resources and capital expenditure allocated to the USE level by PRES (through FONCODES). The growth of inequity in allocation of public resources should be watched closely.

- *Indicators of learning outcomes (e.g. test scores).* These would be logical areas for monitoring so that input measures can be tied to outcomes. The existing questionnaire does not contain questions on school-level resources and public allocation per student. Expansion of the questionnaires is desirable to cover these and other variables on family background (parental education, income, family resources, amount of household expenditure on education), study habits, and teacher characteristics, to assess determinants of achievement. It would help analysis if more questions are constructed for obtaining continuous variables rather than categorical variables. Studies of determinants of achievement would be helpful to identify effective policy interventions to help disadvantaged schools.

- *Household expenditure on education.* This would be another key area to follow up. Given that INEI conducts such a survey annually, the data source for such an undertaking is available; only analysis needs to be undertaken. Closer cooperation between INEI and MED would help improve the questionnaire for data collection so that the education portion contains the relevant questions that can address issues for household finance. For example the Cuanto dataset used by this report merges tuition fees with transportation and lunch. This does not allow assessment of the impact of fees alone on a household's decision to send their children to one type of school versus another. The question of extra tutoring should also be included because this area is where the rich tend to spend much more than the poor and it provides a proxy as to how much additional money is needed to ensure desirable learning outcomes. Analysis of the household survey would enable the Ministry of Education to monitor distribution of public expenditure by consumption or income quintile (Lorenz curve), changes in the elasticity of demand (Engel's curve) for education, and private and social rates of return to education.

Currently, responsibility for all aspects of education is fragmented across ministries and institutions—MED, universities, regions, decentralized institutions, PRES, as well as PROMUDEH and MINSA. There is an urgent need to improve the coordination of educational policy and financial matters between these budgetary entities. It is recommended that a sectorwide coordinating body be established that meets at least quarterly to review overall education policy, performance indicators of each subsector, and intrasectoral allocation of resources (gross and net of pension), in order to ensure consistency of overall education policy and finance. The minutes could be made available to all ministries concerned to keep them informed, as well as to CIAS to improve intersectoral coordination.

Given that there is no accurate information on how many teachers (both appointed and contracted) are in the system, it is very difficult to assess whether resources have been used efficiently. At the same time, the lack of information in school-level finance in

both public and private schools impedes the formulation of policy towards regulating private schools to ensure standards and safety, and towards expanding secondary education through better use of private-school capacity and resources (such as the use of vouchers to buy places in private schools). The combined need to have accurate information on teachers and school-level finance in public and private schools, therefore, calls for conducting an education census. This needs to be taken at the school to obtain information on schools, teachers, and students. Information could provide a useful database to map out strategy to expand secondary education and to improve quality of primary education, as well as to explore options for formula-based funding.

Currently there is an inflexible criteria for allocating resources, based on the number of teachers on permanent payroll in 1995 without responding to the reality of changing student populations. This is not an efficient mechanism in the long run. This inflexible criteria has not taken into account the rural to urban migration and also disadvantages the populations with very high birth rates, namely, the indigenous and low income populations. It is desirable to evaluate the option of using capitation grants in large public schools (but using a different formula for small rural schools) as a basis of allocations, to reflect the reality of changing student populations and to make allocation decisions transparent. Schools should be given the discretion of how best to use the capitation grants in terms of purchasing a mix of inputs, such as hiring teachers, buying instructional materials, or installing lab facilities. In addition, certain categorical grants should be provided to regional education directorates for them to earmark assistance for disadvantaged areas/schools/persons.

Increased international competition and technological change have led to growing demand for a higher level of skills in the labor force. This has translated into rising pri-

**Fig. 35. Estimates and Projection of School-Age Population, 1995-2020**
vate returns to higher education, which will fuel further demand for higher education. To properly support higher education and ensure quality, it is important to improve the transparency of the funding mechanism, with incentives to reward efficiency and quality, as well as to share costs with students, who are the chief beneficiaries of their own education. Increased cost sharing also needs to be supplemented by student financial assistance such as student loans to ensure the academically deserving will not be disqualified due to financial constraints.

Although this report does not cover higher education, given that policy and expenditure on higher education impact on lower levels of education, it will also point out areas for further investigation. In-depth review of funding of higher education is desirable to assess options for introducing funding formulas for higher education (such as fulltime equivalency based allocation) with incentives for improving efficiencies (such as that a certain allocation is based on graduation rates within a certain time frame), and examine the adequacy and impact of cost sharing (such as estimating the elasticity of demand and a survey of students' financial situation and expected earnings after graduation). This exercise should involve MED, MEF, and higher education institutions, and inform overall education policy of the country.

## 5.4. Conclusion

The 1993 Constitution enshrines the principle of compulsory and free preschool, primary, and secondary education. To the extent that there is strong evidence in many countries of the positive impact of preschool on subsequent student behavior and achievement, it is educationally very sound for the Ministry to include preschool in basic education. As for secondary education, the projected growth of the cohort between 12 and 15 years of age in the first 15 years of the $21^{st}$ century highlights the need to address their educational needs (Figure 35). Given the association of high crime rates and poor, young males in many countries, the education of adolescents will provide many unmeasurable social benefits.

Population projections by the World Bank estimate that the cohort of ages 6 to 11 (the primary education age group) will rise modestly between the present and 2010 and then decline afterwards, while the 12-to-15, 16-to-17, and 18-to-20 age-groups will increase throughout the first two decades of the next century. There is likely to be increased pressure for education resources, including demand for qualified teachers in secondary and tertiary education. The reprieve provided by the declining primary school-age population would come only after 2010. If nothing is done immediately, many cohorts of students will miss their educational opportunity and sink into poverty.

What might the resource requirement be to meet the Constitutional Mandate of universal basic education? Based on a rough estimate, it would probably cost the country an additional 2 percent of GDP, net of pensions, if the minimum standards are to be achieved for *all students at all grade levels*. This would still be within the range of the regional average of the Latin American Region. This would enable the government to simultaneously improve internal efficiency and extend access to the out-of-school population in order to ensure every child the opportunity to acquire the skills of a complete

secondary education cycle. This would also raise per student spending. Although the exact costing could only be done after knowing the Government's input mix in providing universal coverage, simply relying on efficiency gains or shifting resources in the margin could not provide the resources necessary to meet the Constitutional Mandate.

Many countries have committed far more public resources to education than has Peru, but without achieving universal coverage for basic education. For these countries, increasingly binding fiscal constraints and continued needs to expand coverage sharply constrain the policy agenda. Peru, in contrast, has positioned itself to initiate a major drive to consolidate equity gains while improving quality.

Peru has indeed reached a crossroads concerning education. The status quo reflects substantial progress, and one direction for the future would continue that path. The other and more ambitious direction would entail commitment to a reoriented human resource strategy for poverty reduction and economic growth. This path would require, over time, substantially increased public expenditures on education. An increase from 2.4 percent to 4.5 percent of GDP net of pension expenditure (to the Latin American average) is, for Peru, feasible in the medium term, given its past experience of limited public financial commitment to education. With such an increase in expenditures, financing a second-generation of reforms along lines discussed earlier, Peru has the opportunity to markedly enhance the intellectual ability and competitiveness of its labor force within a generation. No policy challenge is more significant.

## Table 5: First Generation Reform and Its Implications for Second Generation Reform

| First generation reform | Public finance | Household finance | Equity, quality, and efficiency | The teaching profession |
|---|---|---|---|---|
| **Rationalization of public service, increased use of contract staff in the central ministries, and privatization of pensions.** | Measures to contain cost provide the starting point to improve efficiency in the use of resources. Potentially, public resources can be used to improve quality or expand access. It is important to establish transparent funding criteria to improve efficiency and equity. | There is no immediate impact on household finance of education. But if these measures release more public resources to improve quality or extend access, households will benefit from it and match public investment. | Could be negative in the short run, but should improve quality in the long run, if an accountability system is properly set up. | Negative effect on morale in the short run. Fairer to offer an open-ended contract for all and use performance to determine duration of employment. Need to set up incentives to reward performance and introduce accountability. Lack of timely statistics of appointed and contracted teachers on the payroll hinders development of policy. |
| **Increasing attention to meritocracy and quality.** | Need to establish transparent evaluation criteria and need policy and resources to reward performance. This will ultimately improve the efficiency of resource use. | If the quality of education has markedly improved, households are likely to be willing to invest even more and start the virtuous cycle. | Monitoring and evaluation should underpin an accountability system that is central to a merit-based system. | In the short run, teachers will feel pressured. Need to support improvement in pre-service training and in-service professional development. Meritocracy should raise status of teachers in the long run. Need to change salary scale to attract and retain competent people in the profession. |
| **Expansion of constitutional mandate for basic education.** | Expanded mandate needs to be supported by increased public investment to realize the goal. | Increased public investment will have a matching effect to solicit additional private spending. | Need targeted support for the poor, indigenous, and rural students to ensure equity of learning outcomes. There must not be a trade-off between quality and quantity. | Affects the supply and demand for teachers. Need to pay special attention to the quality of teacher pre-service and in-service training. |

70

| Legal encouragement of private education and the growth of private education. | Opting out of the public system by the urban rich and middle class may free up resources for the working class and rural students. Lack of supply of private schools in rural areas calls for increased public investment there. | Led to mobilization of more private resources for education. Demand for private education will induce supply in cities, and greater availability of good quality of education may attract more middle class to go for it. | Need to improve quality of public education to avoid further deepening the socioeconomic divide. Need to accredit private schools for quality assurance. | Need to improve incentives in the public system to attract good teachers. Non-monetary incentives include making work environment attractive and breaking teacher isolation. |
|---|---|---|---|---|
| Regionalization of administration and deconcentration of services. | Affects the budget process, intergovernmental transfer of resources, and balance of power. Need to strengthen the ability of the regions to deliver quality services by giving them more discretionary power and resources. | Neutral at the beginning but can be positive if the regions become more effective in meeting local needs and in assisting the poor. | Need to set national standards, monitor performance, and undertake measures to reduce regional variation in learning outcomes. | Need to provide quality assurance through accreditation of teacher training programs, and certification of teachers. The regions should have more flexibility in the recruitment and deployment of teachers. |

## Table 6: Summary of Policy Options

| Objectives | Issues | Suggested measures |
|---|---|---|
| **Improve equity** | Inequity in learning outcomes of poor, rural, and indigenous students due to inadequate public resources; unwillingness of qualified teachers to serve in remote communities; and perhaps poor nutrition and health and lack of preparedness of students themselves. | Provide teachers' guides, textbooks, workbooks, supplemental reading, and audiovisual materials and media (for example, interactive radio) throughout 11 years of basic education to *all* schools. Provide radio sets to families with school-age children in remote communities to enable them to access lessons.<br><br>Expand bilingual education programs; provide bilingual instructional materials, recruit indigenous teachers to serve their own communities, train rural teachers in multigrade teaching.<br><br>Increase compensation to rural teachers and assure job rotation to induce teachers to teach in rural communities.<br><br>Address the health of school children either through services provided directly through the schools, or through targeted publicly financed insurance such as the on-going *Seguro Escolar*, to improve attendance and learning. Consider targeted expansion of the school feeding program given initial positive findings of favorable outcomes with respect to nutrition, health, and attendance. Weigh costs against scope of expansion of the school feeding program.<br><br>Provide information (through the mass media) to parents about how good child-rearing practices and involvement in their children's learning enhances children's interest in learning and improves their school achievement.<br><br>Extend preschool education to disadvantaged communities in order to improve school readiness.<br><br>Provide compensatory education to ensure all children learn all requisite skills relevant to their grade level. |
|  | Inequity in access to secondary and tertiary education of poor, rural, and indigenous students due to lack of supply and inability of households to pay. | Establish distance learning programs (by a combination of programmed text and communication media) to provide secondary education to rural communities.<br><br>Provide scholarships and grants to rural children to enable them to attend secondary schools. |

## Table 6: Summary of Policy Options

| Objectives | Issues | Suggested measures |
|---|---|---|
| **Enhance quality** | Lack of incentives to attract and retain competent people in teaching and to improve performance. | Change salary scale to better reward secondary school teachers, as well as those who have university and postgraduate degrees in disciplines other than education. Unify employment status and offer open-ended tenure to be determined by performance. Reward schools that show improvement.<br><br>Set standards for student learning; set standards for teaching, strengthening teacher pre-service and in-service training (possibly changing the academic requirement for teaching in secondary education); provide incentives for teacher knowledge and skill upgrading; and encourage schools to organize for learning. This entails improving the tools for student assessment and teacher evaluation, as well as building consensus with all stakeholders. |
| | Lack of information for benchmarking own performance to know how much to do in order to improve. | Publish information on performance by school and distribute to relevant actors (DREs, USE, schools, and parents). |
| **Improve efficiency of resource use.** | Lack of sectoral overview of policy to assess its coherence and consistency. | Monitor the trend of public spending on education over time (gross and net of pension), particularly differential spending by urban and rural areas at the USE level; track indictors of learning outcomes; survey household expenditures on education and follow changes in the elasticity of demand as well as the private and social rates of return. |
| | Insufficient coordination of educational policy and financial matters between the budgetary entities that have responsibility for education (MED, universities, decentralized institutions, Regions, PRES, PROMUDEH). | Establish a sectorwide coordinating body that meets at least quarterly to review sectoral policy, performance indicators of each subsector, and intrasectoral allocations to ensure consistency of overall education policy and expenditure. |
| | Insufficient information on teachers and school-level finance in public and private schools to guide policy to improve quality and expand access. | Conduct an education census to obtain information on teachers' profiles and school-level finance. |

| Table 6: Summary of Policy Options | | |
|---|---|---|
| **Objectives** | **Issues** | **Suggested measures** |
| | Inflexible criteria for allocating resources based on the number of teachers on permanent payroll without responding to changing school-age population. | Clean up payroll list and set up a centralized database.<br><br>Consider using funding formula based on average daily attendance with grants to compensate for various categories of disadvantage. Give schools greater discretion to use resources. |
| | Potential issue of intra-sectoral allocation between universities and lower levels of education. | Given that policy and expenditure on higher education impacts on lower levels of education, in-depth review of funding for universities is desirable to assess options for introducing funding formulas with incentives for improving efficiency, and for cost-sharing. |

# Background Notes

# Background Note 1.
## The Structure of Education

The existing structure of education comprises four levels: initial, primary, secondary, and tertiary. (See Appendices 1.1-1.3 for enrollment in public institutions, Appendices 1.4-1.6 for enrollment in private institutions, and Appendices 1.7-1.9 for total enrollment). Initial education is offered in daycare for those under the age of 3 and in kindergartens for those between the ages of 3 and 5. There is also a nonformal system of initial education. It is estimated that about 20 percent of those under 5 are having some form of initial education (INEI, 1997). In 1997, 522,000 children enrolled in initial education in the public system, and 147,000 in private organizations. In a recent proposal for restructuring education, one year of initial education is to be made compulsory and form part of basic education.

Primary education comprises six grades, intended for the age group between 6 and 11, but also available to adults who have not received it. In 1997, about 3.7 million persons enrolled in public formal and nonformal programs, and 491,000 in private programs. The majority of primary schools are coeducational and the program of study comprises 25 hours per week during 36 weeks per year (900 hours per annum).

Secondary education is offered to the age group between 12 and 16, as well as to adults who did not have it. In 1997, about 1.6 million enrolled in public secondary schools, and 318,000 in private schools. Secondary education is organized in two cycles: the first has a common curriculum for all students in Grades 7 to 8, and the second has a diversified curriculum of three years, divided into science and humanity streams. Secondary education is offered at 36 hours per week for 38 weeks in a year (1,368 hours per annum).

Tertiary education includes nonuniversity and university education. Nonuniversity institutions include teacher training institutions (*institutos superiores pedagógicos* or ISPs for short), technical education institutions (*institutos superiores técnicos* or ISTs), and schools for the arts. In 1997, 211,000 students attended public universities, and 129,000 private universities. Another 165,000 students enrolled in public tertiary institutions, and 139,000 in private institutions.

In 1997, MED proposed major changes in the structure of the system, with the aims to improve the articulation between levels, to meet needs of a changing labor market, and to improve system efficiency and organizational flexibility. It pledged to universalize one year of initial education, improve the quality of primary education, reduce secondary education from five to four years, and introduce two years of preparatory course work (*bachillerato*) which will provide the transition to tertiary education or to the world of work. In other words, basic education will comprise 11 years of instruction, which includes one year of preschool, six years of primary, and four years of secondary education.

What is new is not only the structural change but the introduction of certifications of study at three levels: at the end of basic education, *bachillerato*, and tertiary nonuni-

versity education, respectively. Accreditable capacities of basic education will include: (a) comprehension of reading, editing, communication, and expression; (b) development of logic and mathematics; (c) management of the basics of technology and informatics; (d) facility for continuous learning and holistic reasoning; (e) creativity and imagination; (f) understanding of environment; (g) local, national, and universal culture; (h) basic work and organizational abilities; and (i) basic knowledge of an international language. Accreditable capacities of the bachillerato will include: (a) productive use of resources (time, space, skills, and technology); (b) abilities to search and select information; (c) facility for analysis, synthesis, abstraction, and systematization; (d) proficiency in an international language; (e) intermediate professional competency; (f) tools for management and self-employment. Students will be certified after having had no less than 2,500 hours of studies in tertiary nonuniversity education.

The proposed bachillerato is divided into two streams: (a) scientific and technological, and (b) scientific and humanistic. The former will prepare for studies in engineering, medicine, mathematics, the sciences, and accounting in universities, and technical courses in tertiary nonuniversity education. The latter will prepare for studies in law, education, the social sciences, and humanities in universities, and tourism, graphic arts, translation, catering, and public relations in other tertiary education. In each stream, there will be a core curriculum and other subjects that prepare for the world of work. The core curriculum is shared by both streams and includes science and technology, earth science, oral and written communication, economics and management, informatics, history of Peru, natural philosophy, and international language. Bachillerato can be offered by (a) secondary colleges as add-ons to their four years of secondary education, (b) universities before the beginning of undergraduate studies, (c) postsecondary institutes before the beginning of two years of tertiary education, and (d) academic institutes specialized just in offering bachillerato.

This ambitious plan requires investment in infrastructure, curriculum development, and teacher training. The implementation of bachillerato is sequenced as follows. In 1997, the proposed structural change was made public; the modernization of the secondary curriculum has begun; the transitional fifth year of secondary schooling was elaborated; and the bachillerato curriculum was proposed. Subsequently, a law was promulgated to give the structural change legal force; new curriculum and training of principals and teachers was piloted; the development and distribution of education materials in secondary education was initiated; a new administrative system was set up; and infrastructure was planned. Thereafter, a second application of transition curriculum in the fifth year of secondary was implemented; training of teachers; and equipping institutions for implementation of bachillerato with followup and monitoring. Full scale implementation was expected to begin in 2000, affecting 200,000 young people each year. The following year will see the first batch of graduates from bachillerato. The effort to revamp the education system is expected to come to fruition in 2007.

# Background Note 2.
# Income Elasticity of Demand for Education and Engel's Curve[1]

The share of household expenditures for education were analyzed using an Engel equation framework. The explanatory variables include the logarithm of income (here proxied by total expenditure), the logarithm of the size of the household, and a set of variables intended to capture the gender and age composition of the household (with age brackets set up to correspond to the various levels of education in Peru). The explanatory variables also include a dummy for residence in the Lima metropolitan area, and three variables indicating, respectively, the education level of the household head, whether or not the household head is male, and whether or not the household head belongs to an indigenous group. The focus of analysis in this section is the expenditure variable, but the other variables are included as "control" variables, so that the coefficient estimates reported in this section are not biased. In other words, it is important to be sure that what we call the effect of income is indeed the effect of income, and not, say, the effect mainly of the education of the household head. In addition to estimating the Engel function for expenditure, we also provide estimates for expenditures on Food, on Health, and on Other Expenditures. The object of the analysis is to compute income elasticities for each of the budget shares.

It is an empirically established fact that the income elasticity for food shares is negative, because poor households need to spend larger shares on food, but an a priori judgment cannot be made about the income elasticities of the other budget shares. In particular it is important to compare the income elasticity for education with those for health. The object of the analysis is to estimate a value for $b$, the slope on income in the budget share regression, as well as $\eta$, the income elasticity which tells us the percentage points by which the budget share goes up for a given percentage increase in income.

The estimates from the Engel function analysis are presented in Table 1. It can be seen from the table that the average budget share for education is 0.0467 and the coefficient on log total expenditures is 0.0128. The respective values for health related expenditures are 0.0411 for the average budget share and 0.0151 for the coefficient on log total expenditures. The income effect of food has the expected negative sign and the coefficient on log total expenditure for food share is of the same order of magnitude as reported from other countries.

It is of interest to note that the dummies for Lima, rural location, female head, and indigenous head of household are economically and statistically insignificant in the education share regression. Some of these dummy variables are important in the food share regression, such as the 0.1315 effect of a rural location. The lack of significance of the dummy variables for the education share, in contrast with the significance for food share, tells an important story about the stability of preferences for education across households

---

[1] This analysis was undertaken by Suhas Parandeker.

which vary across these measured variables. The estimates of elasticity, derived from the regression coefficients are reported in Table 2.

## Table 1: Determinants of Household Budget Shares

| Explanatory variables | Budget Shares | | | | Mean |
|---|---|---|---|---|---|
| | Education | Food | Health | Other | |
| | OLS Coefficient (t-value for $H_0$ Coeff. = 0) | | | | (Std. Dev.) |
| Intercept | -0.1424 | 0.8066 | -0.0970 | 0.4328 | |

| Table 2: Elasticity Estimates from Engel's Curves | | | | |
|---|---|---|---|---|
| | Expenditure Group | | | |
| Elasticity | | Food | Health | Other |
| Budget share with respect to total expenditure | 0.274 | -0.0747 | 0.3674 | 0.0241 |
| Specific expenditure with respect to total expenditure | 1.274 | 0.9253 | 1.367 | 1.024 |
| Budget share with respect to household size | -0.6133 | -0.0969 | -0.0613 | 0.0769 |
| Specific expenditure with respect to household size | -0.6133 | -0.0969 | -0.0613 | 0.0769 |

The findings from the Engel's curve analysis are a mixed blessing. On the one hand, the income elasticity is a low 0.27, and education expenditures are considered to be a necessity by Peruvian households.[2] This is a positive finding, as it indicates that there is a strong underlying demand for education in Peru. A high income elasticity would indicate that the item of expenditure is a luxury—households spend money on luxuries when they have the money, but simply do without it when they do not have money. The relative magnitudes are small, but the evidence also suggests that education expenditures are less responsive to changes in income as compared to expenditures on health.

However, from the point of view of educational policy, the implication is that we cannot rely on general increases in income to bring about greater expenditures on education. For every doubling of household income, the budget share spent on education would go up only by a quarter. Add this finding to the fact that levels of household expenditure on education vary vastly by income level. (This fact can be seen from the Lorenz curve analysis reported in the main body of this report—the total amount spent on education by the richest quintile in Peru was more than 13 times the total amount spent on education by the poorest quintile.) The findings show the need for specific policy instruments that will address the inability of poorer households to incur additional expenditures.[3]

---

[2] Mwabu's work on Kenya indicated a much higher income elasticity of education expenditures of 0.73.

[3] To make sure that the conclusion was not based just on one pooled set of regressions, the regressions (not reported here) were run separately for subsamples by indigenous and nonindigenous, rural and urban, and poor and rich. Consistently, the pattern is that the income elasticities are lower for the more disadvantaged groups.

## Engel's Curves: Formulae for Elasticity Estimates

The Engel curve estimates are based on the following equation, presented as Equation (3) in the Working Paper by Germano Mwabu.[4]

$$w_i = \frac{p_i q_i}{x} = \alpha_i + \beta_i \log(x) + \eta_i \log(N) + \sum \gamma_{ij}(n_j / N) + \delta_i z + \varepsilon_i$$

where

$w_i$ = the share of expenditure of the $i$ th grouping of household expenditure items.

$i$ = household spending for the four groups, viz., education, health, food, and other expenses. (The share is conceptually equal to $p_i$ times $q_i$, the price times the quantity, divided by the total expenditure $x$, but $p_i$ and $q_i$ are not empirically observed as separate entities in the actual estimation of the Engel curve.)

$n_i$ = the number of family members in the age-by-gender group j. These groups range in the reported estimation from (boys aged 0 to 5 years) to (girls aged older than 22 years).

$N$ = the total family size, thus $(n_j/N)$ represents the relative size of group j in the family.

$z$ = a set of control variables. These include (a) dummy for residence in metropolitan Lima, (b) dummy for residence in rural area, (c) female head of household, (d) indigenous head of household, and (e) education in years of the head of household.

$\varepsilon_i$ = the error term in the regression equation, assumed to be i.i.d. normal.

$\alpha_i, \beta_i, \delta_i, \gamma_i$ = the parameters to be estimated.

The equations for elasticities follow from the above equation. Letting $S_i$ represent the elasticity of the budget share for expenditure group $i$, and $E_i$ represent the elasticity of specific expenditure with respect to total expenditure, $x$, and household size, N, the elasticities are:

a) $S_{ix} = \beta_i/w_i$

b) $S_{iN} = 1/w_i \ (\eta_i - \sum_j \gamma_{ij} \ (n_j/N))$

c) $E_{ix} = 1 + (\beta_i/w_i)$

d) $E_{iN} = 1/w_i \ (\eta_i - \sum_j \gamma_{ij} \ (n_j/N))$

---

# Background Note 3.
## Private and Social Returns to Public Education
## in Urban Peru[5]

To estimate the private and social rates of return to public education, the rate of discount (r) was calculated. This discount rate equalizes the stream of discounted benefits to the stream of costs related to a given level of education at a given point in time. Thus, r can be determined by solving the following equation:

$$\sum_{t=1}^{T} \frac{(W_n - W_{n-1})_t}{(1+r)^t} = \sum_{t=1}^{K} (W_{n-1} + C_n)_t (1+r)^t \qquad (1)$$

where  $n$  = Level of education

$T$  = Number of periods in the labor market of an individual with "$n$" education

$W_n$  = Yearly labor income of individual with "$n$" education

$K$  = Number of periods taken to achieve "$n$" education

$C_n$  = Direct costs of studying for level "$n$" education.

The left hand side of the equation represents the benefits of achieving the additional level of education, which is simply expressed by calculating the present value of the differential between the earnings with "$n$" education and "$n$-1" education. The cost of studying "$n$" education is expressed in the right hand side of the equation, and its two elements represent the foregone earnings (assuming that no one works while studying) and the direct costs of having achieved "n" education (basically, tuition).

The data for this calculation was obtained from Instituto Cuanto's household survey of 1997. The analysis was restricted only to urban areas.[6] The sample was constrained to those individuals that had always studied in the public system, so the estimated rates of return would only capture the effect of public education. Instead of calculating streams of average income by age and level of education, we decided to estimate an earnings function to calculate the yearly income associated with the educational level and age of the individual. Hence, the following equation was estimated separately for males and females in the sample:

---

[5] This analysis was undertaken by Jaime Saavedra, with assistance of Eduardo Maruyama.

[6] In Peruvian rural areas, household survey measurement of labor income is highly inaccurate due to high participation of self-employment, high seasonality, self-consumption, etc. Usually, expenditure data is recommended instead of income data for these areas.

$$\ln Y = \beta_0 + \sum_{n=1}^{4} \beta_{1n} EL_n + \beta_2 AGE + \beta_3 AGE^2 + \sum_{n=1}^{4} \beta_{4n}(AGE \times EL_n) + \sum_{n=1}^{4} \beta_{5n}(AGE^2 \times EL_n) + \beta_6 HY$$

(2)

where  $Y$    =  Yearly labor income

$EL_n$  =  Dummy variable for educational level "$n$" (1 = Primary education, 2 = Secondary education, 3 = Nonuniversity higher education, 4 = University higher education)

$HY$   =  Hours worked per year.

This specification allowed finding different life-cycle earnings patterns for all educational levels (including no education), i.e. to find the streams of $W_n$ required in equation (1). For the private rate of return, the basic assumption was that public education had no direct costs,[7] so the only costs of a given level of education were the foregone earnings. To calculate social rates of return we used 1997 nationwide public expenditure data by level of education and student as the direct cost of education. Table 1 shows the regression coefficients obtained from equation (2). Table 2 in Chapter 3 shows the results of solving equation (1), for males and females.

Given the low level of significance of many variables in the regression shown in Table 2 of Chapter 3, we tested the linear hypothesis that all the coefficients of a given level of education were equal to zero. For example, for primary education we tested the following hypothesis:

$$H_0 : \beta_{PRIMARY} = 0, \beta_{PRIMARY \times AGE} = 0, \beta_{PRIMARY \times AGE^2}$$

Results of these tests are shown in Table 2.

---

[7] It must be noted that even though tuition is free in the public system, families' expenditure in education might be important if we consider the amount spent in school uniforms, books, etc.

**Table 1.**

# Background Note 4.
# Determinants of Achievement[8]

Analysis of determinants of achievement is an important tool to inform policy choice. This study uses the analytical approach of hierarchical linear modeling to identify the factors affecting math achievement at the levels of students, schools, and departments. The findings cannot be used to evaluate the impact of education policy of the 1990s because of the usually long time lag between intervention and effects on teaching and learning in the classroom.

## 1. The dataset.

The dataset was drawn from the first national standardized test of mathematics in Grade 4 in 1996 and the accompanying questionnaires. The sample comprised 50,479 students who were selected from a population of 618,719 Fourth Graders in 1,275 schools in 25 departments. Thirty students in each sample school were given the test, which lasted for an hour. The sample included private and public schools but under-sampled rural schools. Single-teacher schools in remote areas were excluded; these accounted for 29 percent of all schools in the country and enrolled about 6 percent of the population of Fourth Graders. This sample frame has resulted in a relatively narrow achievement gap between urban and rural areas.

*The dependent variable* (also known as the outcome variable) relates to performance on the mathematics test. For simplicity, this will be referred to as outcomes or achievement in this Note. The assessment instruments included multiple choice items in sets, natural numbers, fractions, decimals, geometry, and international units and money. Because the answers required were not dependent on interpretation, this outcome measure can be considered a reasonable measure of performance in mathematics. This analysis applied reliability tests[9] and found the instrument reliable. The scores are informative about the relative performance of students compared among themselves.

---

[8] The analysis of data was undertaken by Pete Goldschmidt.

[9] The reliability of a test is defined as the consistency of the information, or scores, obtained. Any test occasion will produce some errors of measurement, which are assumed to be random. That is, students taking the same test on different occasions will score slightly differently due to chance errors (e.g. accidentally marking the answer as B, when they mean C). If the analysis entails using the total test score, then what is of concern is whether any individual (or set of) item(s) scores are not related to the overall test score. There are several methods to estimate reliability. A simple method, which highlights what reliability is, is the spilt-half method. The split half method randomly divides the test in half and correlates the two halves. This would yield a reliability coefficient. More commonly, and the method used for this test, is to generate Cronbach's Alpha; which is to correlate all possible scores with n-1 test items (i.e. remove item 1 from the score and correlate to the test with item 2 removed, etc.). The dependent variable in this study has passed these tests.

*The independent variables* (also known as the predictor or explanatory variables) were mostly drawn from, but not limited to, information collected by three questionnaires which accompanied the math test for the principal of the sample school, the teacher of the subject, and parents of the 30 students who took the test, respectively. The independent variables selected for this analysis are as follows:

- At the student level (also known as level 1), the predictor variables were grouped into four categories: (a) ascriptive characteristics (gender, mother tongue, and student age), (b) availability and usage of text materials, (c) student attendance and study habits, and (d) parental roles and expectations.

- At the school level (also known as level 2), the predictor variables were divided into seven groups: (a) geographic (such as urban and rural, and the coast, mountain, and jungle) , (b) public or private school type, (c) text usage, (d) teacher characteristics, (e) teacher roles, (f) principal characteristics, and (g) parent roles.

- At the department level (also known as level 3), the predictor variables were drawn from four data sources: (a) variables which were aggregated from the student- and school-levels in the 1996 test dataset (such as departmental percentage of private school students, over-aged students, female students, Quechua speaking students, $4^{th}$ Grade teachers with a Master's degree, and with a title from Institutos Superiores Pedagogicos); (b) government expenditure data on public spending on basic education per student by department in 1994; (c) household survey data on household expenditure on basic education per capita by department in 1994; and (d) FONCODE's 1993 Poverty Map, which provided information on departmental characteristics (such as poverty index, percentage of population in chronic malnutrition, mortality rates, illiteracy rates, and school nonattendance rates).

This dataset has certain *limitations*. First, the assessment was undertaken at a single point in time so it is not possible to control for prior learning. Second, the questionnaires did not contain questions on parental education, number of siblings at home, family socioeconomic status (SES) or resources (e.g. family income or expenditure, type of dwelling, availability of water and electricity, etc.),[10] or school resources (e.g. public spending per student, parental contribution per student, availability of water, electricity, library and laboratory, etc.). In other words, some key predictors were not available to enable controlling for their effects. The only variables that may proxy public and private finance of education were public and private expenditure at the departmental level.

---

[10] Although the questionnaire contains a question on parental occupation, the inclusion of the housewife category into the list confounded the effects because a large number of mothers checked this category. Therefore, it is not possible to even use occupation as a proxy for SES.

## 2. Descriptive statistics

In the main text of this report, Table 3 presents the average scores and standard deviation of the mathematics test. The outcome differentials were substantial, particularly between private and public schools, Spanish-speakers and Quechua-speakers, and between the jungle and other regions. The coefficients of variability show large disparity within each subgroup.

Table 1 below presents the mean, standard deviation, minimum and maximum value of variables at the student level. Most of the data were collected from a few questions on students attached to the test and from the questionnaire for parents. Although the original sample had 50,479 students, only 40,766 returned the test, of whom, only 33,233 respondents had all the observations. The most common missing value was gender and type of school attended. Nonetheless, the mean did not change.

In Table 1, the column which shows mean or percentage indicates either the average value of the variable or the percentage share of each categorical variable (for example, girls accounted for 50 percent of the students in the sample). The percentage share of omitted variables, such as boys (which are used for comparison with predictors in the same categories) can be deduced from the percentage share of girls, and its standard deviation can be derived from the formula in the footnote.[11]

| Table 1: Descriptive Statistics of Student-Level Variables Used in the HLM Model | | | | |
|---|---|---|---|---|
| | Mean or Percentage | Standard deviation | Minimum | Maximum |
| **Ascriptive characteristics** | | | | |
| Girls (boys omitted) | 0.50 | 0.50 | 0 | 1 |
| Aymara | 0.03 | 0.35 | 0 | 1 |
| Quechua (Spanish speakers omitted) | 0.15 | 0.16 | 0 | 1 |
| Student over the age of 10 for Grade 4 | 0.23 | 0.42 | 0 | 1 |
| **Materials (text books)** | | | | |
| No textbooks | 0.15 | 0.36 | 0 | 1 |
| School provided textbooks | 0.06 | 0.24 | 0 | 1 |
| Sibling's textbooks (dictated by teacher omitted) | 0.21 | 0.41 | 0 | 1 |
| **Student attendance & study habits** | | | | |
| Daily attendance (sporadic attendance omitted) | 0.07 | 0.26 | 0 | 1 |
| No studying | 0.01 | 0.08 | 0 | 1 |
| Studies regularly | 0.27 | 0.44 | 0 | 1 |
| Studies for exams | 0.16 | 0.37 | 0 | 1 |
| Studies because expected | 0.20 | 0.40 | 0 | 1 |
| (Studies because of self-motivation omitted) | | | | |

---

[11] The equation for standard deviation is $((p(1-p))/n)^{\wedge}.5$. p is the proportion of 1's; so if the left out category is boys, for example, p for them would be 1-.493 (or it could be done as 100-49.3). $^{\wedge}.5$ is the square root. In case of percentage being presented as decimals, the equation would need to be adjusted to 100-p.

| Parental expectation, roles & home environment: | | | | |
|---|---|---|---|---|
| **Goal of schooling** | | | | |
| Develop literacy | 0.19 | 0.39 | 0 | 1 |
| Develop nothing | 0.06 | 0.24 | 0 | 1 |
| Develop comprehensively | 0.23 | 0.42 | 0 | 1 |
| Develop math (Learning well in general omitted) | 0.13 | 0.34 | 0 | 1 |
| **Home academic support** | | | | |
| Environment for studying (through homework omitted) | 0.09 | 0.28 | 0 | 1 |
| None | 0.22 | 0.42 | 0 | 1 |
| Special education programs | 0.01 | 0.11 | 0 | 1 |
| Additional reading | 0.19 | 0.39 | 0 | 1 |
| Father assistance (Mother assistance omitted) | 0.20 | 0.40 | 0 | 1 |
| No assistance | 0.25 | 0.43 | 0 | 1 |
| Other family assistance | 0.23 | 0.42 | 0 | 1 |
| Sample size | 33,233 | | | |

Table 2 presents descriptive statistics of school-level predictors. Some of the variables were aggregrated from the student level (such as the school means of students' accessibility to text), while others were collected from surveys of teachers and principals.

| Table 2: Descriptive Statistics of School-Level Variables Used in the HLM Model | | | | |
|---|---|---|---|---|
| | Mean or percentage | Standard deviation | Minimum | Maximum |
| **Geographic** | | | | |
| Rural (urban omitted) | 0.19 | 0.39 | 0 | 1 |
| Selva | 0.21 | 0.41 | 0 | 1 |
| Sierra (costa omitted) | 0.37 | 0.48 | 0 | 1 |
| **School type** | | | | |
| Private (public omitted) | 0.14 | 0.35 | 0 | 1 |
| **Text usage** | | | | |
| No text | 15.41 | 14.93 | 0 | 100 |
| School provided text | 6.21 | 8.57 | 0 | 77 |
| Siblings and/or other people's text (Teacher's own text omitted) | 20.95 | 13.36 | 0 | 100 |
| **Teacher characteristics** | | | | |
| Number of years of service | 12.17 | 7.59 | 1 | 57 |
| Number of training courses (1990-96) | 6.83 | 2.96 | 0 | 11 |
| Teacher language: Aymara (Spanish omitted) | 0.01 | 0.10 | 0 | 1 |
| Teacher language: Quechua | 0.08 | 0.27 | 0 | 1 |
| Teachers graduated from universities | 0.15 | 0.36 | 0 | 1 |
| Teachers graduated from ISP | 0.51 | 0.50 | 0 | 1 |
| Teachers graduated from IST | 0.01 | 0.11 | 0 | 1 |
| Teachers graduated from professional courses | 0.17 | 0.37 | 0 | 1 |
| Professional titles in other specialties | 0.01 | 0.11 | 0 | 1 |
| University graduates | 0.06 | 0.23 | 0 | 1 |
| University leavers (finished courses without degree) | 0.03 | 0.16 | 0 | 1 |

| Table 2. (continued) | | | | |
|---|---|---|---|---|
| | Mean or percentage | Standard deviation | Minimum | Maximum |
| Secondary school graduates (Secondary leavers with teacher training omitted) | 0.00 | 0.06 | 0 | 1 |
| Condition of work (first of class omitted): Titled | 0.03 | 0.18 | 0 | 1 |
| Contracted | 0.16 | 0.36 | 0 | 1 |
| **Teacher roles** | | | | |
| Explain materials | 0.11 | 0.32 | 0 | 1 |
| Invite specialized persons* | 0.01 | 0.08 | 0 | 1 |
| Student participation (Assess performance omitted) | 0.79 | 0.41 | 0 | 1 |
| **Principal characteristics** (Spanish omitted) | | | | |
| Principal's language: Aymara | 0.01 | 0.11 | 0 | 1 |
| Principal's language: Quechua | 0.10 | 0.30 | 0 | 1 |
| Principal's language: Other | 0.01 | 0.09 | 0 | 1 |
| **Parent roles (according to teachers)** | | | | |
| Check attendance | 0.08 | 0.26 | 0 | 1 |
| Check homework | 0.21 | 0.41 | 0 | 1 |
| Prepare children for exams | 0.05 | 0.21 | 0 | 1 |
| Provide nutrition | 0.05 | 0.21 | 0 | 1 |
| Stimulate learning (no participation omitted) | 0.26 | 0.44 | 0 | 1 |
| Sample size | 1,275 | | | |

*The meaning of teacher's role being to invite specialized persons is unclear from the questionnaire.

Table 3 presents the descriptive statistics of departmental-level variables. Some of the variables were aggregrated from the student level (such as percentage of students who are females, or in private schools), while others were collected from surveys of teachers and principals (such as percentage of teachers with various qualifications).

| Table 3: Descriptive Statistics of Departmental-Level Variables in the HLM Model | | | | |
|---|---|---|---|---|
| | Mean/ percentage | Standard deviation | Minimum | Maximum |
| Public expenditure on basic education per student (US$) | 141.3 | 31.4 | 71.0 | 223.0 |
| Household expenditure on basic education per capita (US$) | 74.5 | 42.0 | 17.9 | 144.0 |
| Poverty index | 3.0 | 1.1 | 1.0 | 4.5 |
| Female students | 49.3 | 2.6 | 44.5 | 56.5 |
| Over-aged students | 23.5 | 10.1 | 10.1 | 42.3 |
| Quechua students | 14.8 | 21.3 | 0.0 | 67.5 |
| Private school students | 14.8 | 11.9 | 0.0 | 50.0 |
| Teachers with MA degree | 12.5 | 12.6 | 0.0 | 44.8 |
| Teachers graduated from ISP | 52.1 | 14.0 | 27.6 | 76.5 |
| Teacher years of service | 11.9 | 1.75 | 8.4 | 15.7 |
| # of training courses attended | 6.8 | 1.0 | 4.6 | 8.3 |
| Sample size | 25 | | | |

# 3. The analytical approach of hierarchical linear modeling

The appropriate approach to analyze this dataset is hierarchical linear modeling (HLM). This is because the structure of the data was hierarchical: student-level variables were nested within schools, and in turn, school-level variables were nested within departments. For example, students' accessibility to text materials is an indicator of students' home resource; but when it is aggregated to the school level, it became an indicator of school resource and the normative environment (Bryk and Raudenbush, 1992). Mixing individual and aggregated explanatory variables can lead to both statistical and substantive errors in interpretation of the effects of the group, such as the school or the department (Aitkin and Longford, 1986; Burstein, 1980).

Group effects are truly important because students with the same characteristics might have different learning outcomes if they attend schools with different organization, quality, policies, and practices or if they live in different departments (Akin and Garfinkel, 1977). For this reason, the Ordinary Least Square (OLS) regression analysis cannot be applied to this dataset because it does not take into account the hierarchical structure of the data. If the variance in test scores attributable to differences between schools is large, OLS regression analysis will severely understate standard errors and overestimate their significance, thereby leading to falsely rejecting the null hypothesis. However, hierarchical linear modeling (HLM) allows personal and contextual (such as school and department) effects on an individual's score to be analyzed (Bryk and Raudenbush, 1992).

*Unconditional models.* The first step in HLM was to estimate the fully unconditional models, which can be at two levels (students and schools) or three levels (students, schools, and departments). The unconditional models for three-level analysis in this study are as follows:

$$Y_{ijk} = \pi_{0jk} + e_{ijk}, \; e_{ijk} \sim N(0, \sigma^2), \qquad \text{(Equation 1)} \qquad \text{(Level 1)}$$

$$\pi_{0jk} = \beta_{00k} + r_{ojk}, \; r_{ojk} \sim N(0, \tau_{0k}). \qquad \text{(Equation 2)} \qquad \text{(Level 2)}$$

$$\beta_{00k} = \gamma_{000} + u_{00k}, \; u_{00k} \sim N(0, \tau_{00}). \qquad \text{(Equation 3)} \qquad \text{(Level 3)}$$

where $Y_{ijk}$ was math test score for student i in school j in department k; $\pi_{0jk}$ was the mean test score at school j in department k; $\beta_{00k}$ was the departmental mean of the test score in department k, and $\gamma_{000}$ was the grand mean of the math test score. The $e_{ijk}$ was the student-level random components in school j in department k; the $r_{ojk}$ was the school-level random components in school j in department k; and $u_{00k}$ was the departmental-level random component in department k. The $\sigma^2$ was the error term (residual) of the variance in test scores between students; the $\tau_{0k}$ was the error term of the total variance in test scores between schools, and the $\tau_{00}$ was the error term of the total variance in test scores between departments.

This unconditional model allowed for the calculation of the intraclass correlation. This provided estimates of (a) the total variance in test scores between students (within schools), (b) the total variance in test scores between schools (within departments), and (c) the total variance in test scores between departments:

$$\rho = \sigma 2/( \tau_{0k} + \tau_{00} + \sigma 2 ) \quad \text{(Equation 4)} \qquad \text{(Level 1, between students)}$$

$$\rho = \tau_{0k} /( \tau_{0k} + \tau_{00} + \sigma 2 ) \quad \text{(Equation 5)} \qquad \text{(Level 2, between schools)}$$

$$\rho = \tau_{00} /( \tau_{0k} + \tau_{00} + \sigma 2 ) \quad \text{(Equation 6)} \qquad \text{(Level 3, between departments)}$$

where $\rho$ was the intraclass correlation, and the error terms (residuals) of the variance on the right side have been described in Equations 1, 2, and 3. Subsequently, the unconditional estimates of the errors in Equations 1, 2, and 3 provided the basis for computing the proportion of variance in test scores explained by additional variables at each of the three levels. It should be noted that HLM does not generate R-squared statistics. The explanatory power of a model is indicated by how much of the proportion of variance in outcome it can explain.

*Conditional models.* The next step was to specify a conditional model with random effects analysis of covariance (ANCOVA) for each of the three levels. At level 1, the model used student-level variables, and allowed the intercept and slopes to vary across schools and departments. The model was as follows:

$$Y_{ijk} = \pi_{0jk} + \pi_{1jk} (X_{ijk} - X_{.jk}) + e_{ijk}, \; e_{ijk} \sim N(0, \sigma^2) \quad \text{(Equation 7)} \quad \text{(Level 1)}$$

where X's were background characteristics of student i (such as girls, over-aged, and Quechua speakers) in school j and department k; and $e_{ijk}$ was the student-level random effect. The intercept term of the conditional model was similar to that in the unconditional model, except that the mean was now adjusted for the covariates (student-level variables). In this case, X's were centered on the school mean (the average value of a given variable of school j).[12] Centering allowed $\pi_{0jk}$ to be interpreted as the mean of school j in department k for test score of student i in the same school, adjusted for differences among schools in student characteristics. In this manner, differences in student characteristics could be taken into account.

---

[12] For example, if there is a continuous variable for the number of hours of studying per week, this could be centered around the mean hours of studying per week at school j, thereby adjusting for the time of students actually studying. One advantage of school-mean centering all the variables is to easily identify the marginal effect of any single predictor, after controlling for the effects of other covariates. This would allow addressing the question of: if a student is an average in all respects at school j, what is the marginal effect of hours studying? For categorical variables, group-mean centering works in the same manner. At levels 2 and 3, grand-mean centering refers to the same procedure and effect.

Unlike OLS regression coefficients, the intercept and slope parameters were subscripted by j and k, indicating that each school could have a different intercept and slope(s). The student-level coefficients, $\pi_{jk}$, could be specified as being either fixed, nonrandomly varying, or randomly varying (Bryk and Raudenbush, 1992). A model with several student-level predictors could have any combination of the three specifications.

If there is significant variation in intercepts and slopes between schools, then this can be modeled by including predictors at the school and student levels aggregated to the mean of school j. Thus the student-level intercepts and slopes became outcomes, and the school-level ANCOVA model was as follows:

$$\pi_{0jk} = \beta_{00k} + \beta_{01k} (W_{.j} - W_{..}) + r_{0jk}, \quad r_{0jk} \sim N(0, \tau_{00})$$

$$\pi_{1jk} = \beta_{10k} + \beta_{11k} (W_{.j} - W_{..}) + r_{1jk}, \quad r_{1jk} \sim N(0, \tau_{11}) \quad \text{(Equation 8)} \quad \text{(Level 2)}$$

where W's were school characteristics (for example, the average years of service of teachers in a school); $r_{0jk}$ was the school-level random effect; and $\beta_{10}$ was the pooled within-school regression coefficient. The W's were centered on the grand mean (see the same footnote on mean-centering). The intercept and slope were modeled to vary randomly and to be affected by a characteristic, W, of school j. The interpretation of $\pi_{0jk}$ would be how the adjusted school means of the outcome, Y, were affected by the school characteristics W's, given student characteristics, X's. Similarly, the slope coefficient could be described as being affected by W's, given X's.

If there was significant variation in intercepts and slopes between departments, then this could be modeled by including department-level predictors, as well as school- and student-level predictors aggregated to the mean of department k. Thus the school- and student-level intercepts and slopes became outcomes. The department-level ANCOVA model was as follows:

$$\beta_{00k} = \gamma_{000} + \gamma_{001}(Z_{.k} - Z_{...}) + u_{00k}, \quad u_{00k} \sim N(0, \tau_{00})$$

$$\beta_{10k} = \gamma_{100} + \gamma_{110}(Z_{.k} - Z_{...}) + u_{00k}, \quad u_{00k} \sim N(0, \tau_{00}) \quad \text{(Equation 9)} \quad \text{(Level 3)}$$

where Z's were department characteristics (for example, the poverty index). The Z's were centered on the grand mean (see the same footnote on centering). The intercept and slope were modeled to vary randomly and be affected by a characteristic, Z, of department k. The interpretation of $\beta_{00k}$ would be how the adjusted departmental mean of the test score were affected by the departmental characteristics Z's, given both student characteristics, X's, and school characteristics, W's. Similarly, the slope coefficient can be described as being affected by Z's, given X's and W's.

In cases where student-level effects varied much between schools and departments, the next step was to analyze whether school and department variables have effects on student-level variables. This was known as the cross-level model.

At level 2, using information from the unconditional and the conditional models, the proportion of the variation in the $\pi$'s is explained by the school-level variables. For example, the proportion of the variation of $\pi_1$ would be computed as follows:

$$[ \tau11(\text{unconditional}) - \tau11(\text{conditional})]/\tau11(\text{unconditional}) \quad (\text{Equation 10})$$

Additionally, a $\chi^2$ test could be used to test whether the error (residual) variation $\tau_{cc}$ was significant; in which case additional variation in $\pi_c$ was left to be explained. This indicated that the relationship between the outcome and the student-level predictor varies significantly from school to school, even when controlling for the school-level variables modeling that particular coefficient.

Similarly, at level 3, the proportion of variation in the $\beta$s can be explained by department-level variables and can also be determined by Equation 10, using the error variances at level 3. As with the level 2 analysis, the relationship between the outcome and department variables could be examined by using a $\chi^2$ test to determine whether the school level predictor continued to vary from department to department after controlling for department-level variables.

## 4. Two-level analysis (student and school)

The analysis began with the student and school levels in order to explore in depth the effects of variables at these two levels on mathematics outcomes. The approach was guided by four questions: (a) What were the marginal effects of various student characteristics on average student performance, after controlling for other covariates in the student-level model? (b) What were the marginal effects of school characteristics on average school outcomes, after controlling for other covariates in the school-level model? (c) What were the cross-level effects? In other words, what were the effects on a student who attended a particular school, after controlling for individual characteristics? (d) What proportion of variance in outcomes was attributable to differences between students (within schools) and between schools?

### (a) Effects of student characteristics on average student outcomes (Level 1 model)

Table 4 shows the marginal effects of each of the above described student characteristics, controlling for other covariates in the model (see Equation 7 for the model).[13] When other concomitant variables were held constant, girls tended to do worse than boys. Students over the age of 10 performed significantly worse than younger children. This comes as no surprise because over-aged students tend to be repeaters. To a lesser extent than gender and age, the mother tongue also had an effect, but it was confined to Quechua speakers who did less well than Spanish speakers. There was no statistically significant difference in the outcomes of Aymara speakers and Spanish speakers. For policy research, it is important to identify the variables that enable Aymara speakers to perform so much better than other indigenous groups.

---

[13] This model did not control for school-level variables.

## Table 4: Effects of Student Characteristics on Student Outcomes

|  | Coefficient | Standard error |
|---|---|---|
| Intercept | 45.1 | 0.45 |
| **Ascriptive characteristics** | | |
| Girls (compared with boys) | -3.58 * | 0.21 |
| Mother tongue Aymara (compared with Spanish speakers) | -0.65 | 0.71 |
| Mother tongue Quechua (compared w/ Spanish speakers) | -0.70 * | 0.35 |
| Student over the age of 10 for grade 4 | -1.84 * | 0.22 |
| **Text usage** (compared with teachers' own text) | | |
| No text | -0.69 * | 0.26 |
| School provided text | -0.38 | 0.36 |
| Siblings' and/or others' text | -0.06 | 0.22 |
| **Student attendance & study habits** | | |
| Daily attendance (compared with sporadic attendance) | 1.62 * | 0.33 |
| No studying (compared with study because of self-motivation) | -2.71 * | 0.98 |
| Study regularly (compared with self-motivation) | -1.69 * | 0.21 |
| Study for exams (compared with self-motivation) | -2.80 * | 0.25 |
| Study because expected (compared with self-motivation) | -3.87 * | 0.24 |
| **Parental expectations of school** (compared with general learning) | | |
| Develop literacy | -1.13 * | 0.23 |
| Develop nothing | -1.98 * | 0.37 |
| Develop comprehensively | 0.42 | 0.23 |
| Develop mathematics | 1.09 * | 0.26 |
| **Home academic support** | | |
| Provide environment for studying (compared with provide support through homework) | 0.46 | 0.31 |
| Provide no support | -0.22 | 0.22 |
| Special education programs | -0.74 | 0.75 |
| Provide additional reading | 1.06 * | 0.23 |
| Father assistance ( compared with mother's assistance) | 0.31 | 0.24 |
| No assistance | 0.86 * | 0.23 |
| Other family assistance | -0.70 * | 0.23 |

* p <=.05

Student attendance and study habits mattered. Students who attended school daily did better than those who attended sporadically. Motivation was important. Students who undertook their study because they were motivated had higher scores than students who studied for other reasons.

Parental roles and expectations also affected achievement. Parents who expected school to develop mathematics skills saw their children performing better in math, compared to parents who expected schools to develop literacy, generally, or nothing. Interestingly, home academic support mattered only when parents provided additional reading

material, not simply through providing a general environment for studying, or through help with homework or other special programs. The assistance of mothers and other family members turned out not to be helpful in this sample. One might speculate as to whether this is due to lower educational level of mothers and other family members.

*(b) Effects of school characteristics on school mean (Level 2 model)*

Table 5 presents the marginal effects of each of the above described school characteristics, controlling for other covariates in the model[14] (See Equation 8 for the model). Holding other concomitant variables constant, rural and urban areas had no statistically different effects on achievement, but geographic region had big effects. Schools in the mountain region performed less well than those on the coast, whereas the jungle region did much worse than the coast. Students in private schools were associated with much higher achievement. The nonavailability of textbooks was negatively associated with learning outcomes. Schools with 50 percent or more of students who had no textbook, or who used their siblings' textbooks, did worse than those whose text was based on dictation by teachers.

Teachers who had more years of service had a positive impact on student achievement, but in-service training did not. This, however, changed in a 3-level analysis. In this two-level analysis, there was also no statistically significant difference between teachers of various academic qualifications, conditions of service, and in-service (but this is not true in a three-level analysis). This may be because there is insufficient variance between schools in these variables to show the difference, but once aggregated to the departmental level, the difference has statistical significance.

A more disturbing finding is that teachers whose mother tongue was Quechua were associated negatively with student math achievement, in comparison with teachers whose mother tongue was Spanish, but this was not true for teachers whose mother tongue was Aymara. Principals' characteristics also mirrored those of teachers. Even after controlling for students' mother tongue, Quechua speaking teachers were associated negatively with math performance. This may be due to Quechua speaking teachers being less prepared, and calls for special attention to the training of Quechua speaking teachers. That Aymara speaking teachers were indistinguishable from Spanish speaking teachers in terms of their impact on achievement disproves the notion that indigenous teachers are not effective. It also poses a very important research question as to why Aymara students and teachers were doing so much better than other indigenous groups. If the variables that enable them to overcome their disadvantage can be identified, they might also be used to help other indigenous peoples.

Teachers' perception of their role made a difference. If teachers perceived that their role was to assess and improve performance, they had large positive effects on achievement, in contrast to those who considered their role simply to explain materials, invite guests, and encourage student participation. This seemed to indicate that focusing on outcomes produced the desired results.

---

[14] This model did not control for student-level variables.

## Table 5: Effects of School Characteristics on School Mean

|  | Coefficient | Standard error |
|---|---|---|
| **Intercept** | 45.10 | 0.37 |
| **Geographic** | | |
| Rural (compared with urban) | -1.84 | 1.04 |
| Selva (compared with costa) | -5.65 * | 1.07 |
| Sierra (compared with costa) | -2.77 * | 0.92 |
| **School type** | | |
| Private (compared with public) | 12.71 * | 1.24 |
| **Text usage** (compared with teacher's own text) | | |
| Difference between % of student at school with (1): | | |
| No text | -0.18 * | 0.03 |
| School provided text | -0.07 | 0.05 |
| Sibling's and/or other's text | -0.13 * | 0.03 |
| **Teacher characteristics** | | |
| Number of years of service | 0.14 * | 0.06 |
| Number of training courses taken (between 1990-96) | 0.14 | 0.13 |
| Mother tongue: Aymara (compared with Spanish) | -0.85 | 3.83 |
| Mother tongue: Quechua | -5.17 * | 1.51 |
| University graduates with teacher's title (compared with secondary school leavers with teacher training only) | 3.39 | 1.90 |
| ISP graduates with teacher's title | 1.69 | 1.67 |
| IST graduates with teacher's title | 2.43 | 3.80 |
| Graduated from professional courses | 0.62 | 1.82 |
| Professional titles in other specialties | -0.94 | 3.83 |
| University graduates without teacher's title | 2.61 | 2.22 |
| University leavers who finished courses but had no degree | -1.11 | 2.79 |
| Appointed by manager (compared w/ officially appointed) | -1.84 | 2.12 |
| Contract | -0.36 | 1.14 |
| **Teacher roles** | | |
| Explain materials (compared with focusing on learning outcomes by assessing performance) | -4.36 * | 1.69 |
| Invite specialized persons (2) | -9.50 * | 4.71 |
| Encourage student participation | -3.48 * | 1.31 |
| **Principal characteristics** | | |
| Mother tongue is Aymara (compared with Spanish) | 6.78 | 3.62 |
| Mother tongue is Quechua | -4.44 * | 1.38 |
| Mother tongue is other languages | -2.22 | 4.20 |
| **Parent roles (according to teachers)** | | |
| Check attendance (compared with no participation) | 3.97 * | 1.51 |
| Check homework | 3.05 * | 1.06 |
| Prepare children for exams | 7.58 * | 1.90 |
| Provide nutrition | 3.24 | 1.86 |
| Stimulate learning | 5.30 * | 1.01 |

Notes: (1) Percent in 00.0% (i.e. to calculate the effect at 50%, the coefficient is multiplied by 50).

(2) The meaning of teacher's role being to invite specialized persons is unclear from the questionnaire.

* $p <= .05$

Parental role *as perceived by teachers* was also important. Parents who checked attendance and homework, prepared children for exams, and stimulated learning had children who performed significantly better than those parents who did not participate in their children's education. This might be an indicator that proactive teachers who tried to get parents more involved and communicate more have positive effects on children. At the school-level, this variable might be a proxy of community support.

*(c) Cross-level effects of school characteristics on achievement slopes*

This analysis examines whether or not the effects of student characteristics varied across school. In other words, were there school-level factors that had mitigated the student-level effects? Ascriptive characteristics of students, accessibility of text, study habit, parental role and expectations, and home academic support were crossed with geographic variables of school location, availability of text, and other school characteristics such as private schools, teacher in-service training, and years of service. Only the coefficients and the standard errors of the group of variables which have statistical significance in some of them are presented in Table 6. Those which has no significance at all were not recorded, leaving blank spaces in the table to make it easier to read.

Table 6 shows that although girls in general performed less well than boys, those in the jungle and mountain regions did better relative to girls on the coast. Girls also did slightly better when schools provided the text. There was no significant difference in math achievement between boys and girls in the rural and urban areas, or in private and public schools.

Overaged students performed worse in general and far worse in private schools, relative to achievement of overaged students in public schools. This might be attributable to a more competitive environment in private schools that did not help overaged students to catch up.

With respect to the mother tongue of students, there was no significant difference in math achievement between Aymara and Spanish speakers, whether they were in private or public schools. Quechua speakers, however, not only performed less well than Spanish speakers in general, they performed significantly worse in private schools, relative to their performance in public schools.

With respect to study habits, students did better when they were self-motivated to study than if they studied because they were expected to. This had a greater effect than the replies on whether they studied only for exams, studied regularly, or did not study at all. However, students in the rural areas performed better if they studied because they were expected to. In private schools, students who did not study performed significantly worse. In fact, the biggest negative effect was found among private school students who did not study, relative to the performance of students who did not study in public schools. It might be because private schools have much higher expectations for studying hard and those who did not study fell behind.

Home academic support had positive effects on achievement only when the home provided additional reading material. The effect of additional student reading was strengthened when teachers had in-service training.

If parental expectation was to develop math skills, versus general learning, there was a positive effect on math achievement. If it focused instead on other goals, such as developing literacy, comprehensive development, or lacked any definite goal, it did not produce higher math scores. However, in rural areas, even if the expectation was to develop literacy, there was a positive effect on math scores; but if the goal was to develop nothing in rural schools, the negative effect was washed out, possibly because it did not matter what the expectations were.

No text was worse than having teachers' dictated notes. But the years of service negatively impacted on the effects of school-provided texts. The reason was unclear.

In summary, the analysis of cross-level effects confirmed some common sense notions. For example, in private schools, students who did not study, were not high achievers in general (those over-aged and Quechua speakers), and those who were not self-motivated did significantly worse than their counterparts in public schools. At the same time, the analysis also revealed many puzzles that require further investigation. For example, why were girls in the sierra and selva doing better, relative to boys, than girls in the costa? Why did Quechua speakers perform worse in private schools than public schools? The greatest puzzle of all is perhaps why experienced teachers were associated with higher math scores, but the score decreased when they could not use their own text and had to use school-provided texts? Could the school-provided text proxy a new curriculum which experienced teachers are less prepared to teach? Answers to these puzzles might help policymakers design more effective interventions.

## (d) Within-school and between-school variance in outcomes

Applying Equations 1, 2, 4, and 5 to the unconditional models, it was found that some 54 percent of the variance in math achievement was attributable to between-school differences, while 46 percent was attributable to within-school differences (between students) (Table 7). The higher the between-school variance, the more inequality among schools there is. Normally, a 30 percent difference in variance is the cutoff point for identifying serious equity problems (See Appendices 5.1 and 5.2).

Student-level variables explained only 4.7 percent of the within-school variance in outcomes. 2.9 percent of the variance was explained by ascriptive characteristics, 0.1 percent by the availability of and usage of texts, 1.2 percent by student attendance and study habits, and 0.5 percent by parental roles.

Between-school variables cumulatively explained 34.2 percent of the variance in outcomes—9.5 percent by geographic factors, 9.5 percent by text usage and homework assignments, 11.6 percent by teachers' characteristics, 0.7 percent by teachers' roles, 1 percent by principals' characteristics, and 1.9 percent by parental roles.

(2) Indicates whether the variance varies significantly after variables are included in model.

(3) The slope for "Gender" was the only one that had significant between-school variation after including level 2 variables

* P<=.05.

It should be noted that the relative weights of these variables reflected the way the questions for principals, teachers, and parents were structured. A lot of the questions aimed at getting the perceptions of these stakeholders, rather than constructing measurable variables to capture the full impact of student attendance and study habits, parental roles, teachers' role, and principals' characteristics. For example, instead of asking how many days in the preceding week the student attended school, the question only asked whether the parent thought that the student attend regularly. These findings point to ways that future questionnaires could be improved.

In spite of the limitations, the analysis of determinants of achievement has policy implications. It found that textbook availability, homework assignments, and teachers' characteristics and roles had effects on achievement. Since all of these variables are amenable to policy intervention, these call for concerted efforts in textbook provision and teacher training, particularly for Quechua teachers, in order to improve learning outcomes.

## 5. Three-level analysis (students, schools, and departments).

From the perspective of national educational policy, inequality in learning outcomes among departments is a serious concern. Since the Educational Directorates of the departments are responsible for delivery of education, identifying the determinants of variance in test scores at the department level is a requisite to addressing the issue. Because the 1996 assessment data are not in the public domain, this analysis is unable to report department-specific results.

The three-level analysis was guided by several questions: (a) What were the marginal effects of departmental characteristics on average departmental test score, after controlling for other covariates in the departmental-level model? (b) How much did school-level factors vary across departments, and how much did student-level factors vary across schools and departments? In other words, did some departments do a better job on student achievement, after controlling for school-level, and student level, characteristics? (c) What was the proportion of variance in test scores attributable to differences between students, between schools, and between departments? The following paragraphs address these questions.

*(a) Effects of departmental characteristics on departmental outcomes (level 3 model)*

In the Main Report, Figures 24 and 25 in Chapter 3 show the relationship between public and household expenditure by department and test scores by department, respectively. This raised the question of whether these two variables merely captured the effects of other variables. Since the issue of education finance has important policy implications, it is imperative to disentangle the effects of other variables from the expenditure variables.

The level 3 analysis began by examining the correlation among the variables at the departmental level. Because of the very high correlation between poverty index, percentage of rural population, chronic malnutrition, mortality rates, illiteracy rates, and school nonattendance, only the poverty index was selected to proxy SES at the departmental level to avoid the problem of multicolinearity (Table 8).

There were still four potential problems in analyzing the relationship between test scores and departmental level inputs. These problems did not permit the use of OLS regression, but could be partially addressed by using HLM:

- *Limited degrees of freedom*: Given that there are only 25 departments, only a small number of predictors could be used. By applying HLM, the variation in student test scores was divided into three components: among students, among schools, and among departments. Only departmental variables were used to explain the variation in test scores between departments.

- *Lack of variability in (and similarity of) departmental measures*: Several of the departmental variables were highly correlated. This problem was addressed by centering the predictor variables. At the student level, the independent variables were centered on the school mean; at the school and the departmental levels, the independent variables were centered on the grand mean. This centering reduced multicolinearity and eased interpretation of results.

- *Ecological fallacy*: This existed when group-level predictors were used to make inferences about individual effects. Using HLM explicitly took the nested nature into account, without ignoring the within-school and within-department variability of test scores.

- *Errors in interpreting the effects of departmental variables on individual student test scores*: HLM enabled interpretation of analyses that simultaneously examined variables at different levels. School- and department-level independent variables identified in what context the effects of student-level independent variables manifested themselves. Or, school- and department-level variables explained some of the heterogeneity among schools and departments in specific student-level effects.

Table 9 presents 11 models which show the marginal effects of additional predictors at the departmental level on the mean of other existing predictors in the model (Equation 9). The major findings are as follows:

Public and household expenditure per student by department together explained about 49 percent of the between-department variance in outcomes (Model 1). However, household expenditure per capita by department has a high level of statistical significance, but not public expenditure. This finding was consistent with that observed in Figures 24 and 25. The lack of statistical significance for the interaction terms between public and private expenditure per student indicated that public and private expenditures did not substitute for each other (Model 2).

Although poverty index has statistical significance, it only explained 18 percent of the variance in test scores (Model 3). Even when poverty index was combined with public and household expenditure, household expenditure per student is the only variable with statistical significance in predicting math test scores (Model 5). Meanwhile, these combined variables explained over half of the variance of test scores between departments.

To have more precise measure, departments were divided into the categories of nonpoor, average, poor, and extremely poor (Model 4). They were combined with public and household expenditure (Model 6). The results in these two models were similar to the above two, respectively. However, when interaction terms were created between poverty and household expenditure per capita, in extremely poor departments household expenditure alleviated the negative effects of poverty on test scores (Model 7).

When the percentage of students in private schools in the department was taken into consideration, the statistical significance of household expenditure disappeared. In extremely poor departments, however, household expenditure still alleviated the negative effects of poverty on test scores (Model 8).

116

After adding the percentage of Quechua speaking students in departments, while the percentage of private school enrollment was retained, the effects of poverty in extremely poor departments changed from negative to positive sign. This signaled that students in high poverty departments are doing marginally better once the effects of private schools and the proportion of Quechua students were controlled for (Model 9). The effects of Quechua speakers remained after the percentage of girls and the percentage of over-aged students were added (Model 10).

When the proportion of teachers graduated from universities and teachers trained in Institutos Superiores Pedagógicos (ISPs) were added, the effects of poverty remained. However, teacher's pre-service education played a significant role—when departments had a higher proportion of well-educated and well-trained teachers, departmental average test scores was higher. It should be noted, though, that teachers graduated from universities did not enhance the achievement of Grade 4th students more than teachers who graduated from ISPs. Students in extremely poor departments performed marginally better after all of these variables were controlled for. The interpretation of this is that if an average student attended a school that was similar to all other schools in the country on average, and if the department in which this school was located only differed from other departments in its poverty level (i.e. extremely poor), this student would be expected to outperform another average student in another department, that only differed by the poverty level.

Given the very small degree of freedom left by the full departmental model (Model 11), in spite of the very large reduction in the percentage of between-department variation in mathematics test scores, the equivalent of the R-squared statistics[15] is reduced by approximately 3 to 15 points, depending on both the number of predictors in the model. For social science, this is very respectable.

*(b) Final 3-level model with interaction*

The 3-level model attempts to identify factors that accounted for variations in mathematics achievement at the levels of students, schools, and departments simultaneously. Since the 2-level analysis had examined in details the determinants of achievement at the student and school levels, this final model focused mainly on the levels of schools and departments. This final model did not use the entire set of level-one predictors due to limitations with the data (the extremely large number of categorical variables). Including all of the potential predictors would make it very difficult computationally to generate estimates. It also would muddle the results when the focus is on departments and schools because so many parameter estimates are unyielding to sort through, and lose meaning when too many extraneous variables are included. It is important to consider the correlation among variables included and excluded in the model; if excluded variables act as significant mediators or moderators between included variables and mathematics achievement, it would be improper to exclude these variables. The student level predictors used in this final model are not affected by those variables excluded from the model.

---

[15] While the interpretation is roughly the same, what is normally referred to "R-squared" is not technically what is calculated.

117

It may be convenient to consider a student's mathematics score as a combination of a mean score, plus some deviation. This deviation can be broken into the student, school, and department components. The mean is itself a function of a grand mean plus school and department level variations. For example, the mean for Lima is equal to the grand (national) mean plus some variaton. Further, a student's individual score is some function of the grand mean plus the deviation associated with attending a particular school in a particular department *plus* effects due to personal characteristics (e.g. being a girl or a Quechua speaker).

The results in Table 10, Part A, indicate that department scores varied significantly, and that between-department results were not appreciably different from those presented in the departmental-level only models (Table 9). Both household expenditures and the proportion of ISP trained teachers were positively associated with mean departmental scores. Holding other variables constant, the performance of extremely poor departments was significantly better than that in nonpoor and average departments.

Table 10, Part B, displays the results of school-level factors that affected mean school mathematics achievement. School level factors could potentially vary among departments. Six school factors significantly impacted school mean achievement:

- The percentage of girls in a school was inversely related to achievement. As Part B indicates, this effect did not vary from department to department (hence a national average effect).

- The percentage of over-aged students was also inversely related to achievement. This effect varied significantly among departments, meaning that some departments have done a better job, on average, than others with over-aged students.

- The proportion of Quechua speakers was also inversely related to achievement. This effect also varied among departments. However, neither the proportion of Quechua speakers in the department, nor the department average poverty level, directly affected this school-level phenomenon[16]. On average, schools attended predominantly by Quechua speakers had lower scores than schools attended predominantly by Spanish speakers.[17]

- The number of years of service a teacher had showed positive effects on math test scores.

- The number of training courses a teacher had attended was positively associated with mathematics achievement. This effect did not vary among schools or departments.

- Students attending private schools scored significantly better than students attending public schools. This effect did not vary among schools or departments. In other words, the effects of private schools were homogenous—on average they were all about the same.

---

[16] Although, as a group these two variables reduce the variation by about 20 percent.

[17] In this particular model, Aymara speakers, who performed about equal to Spanish speakers, were grouped together with Spanish speakers.

Table 10, Part C, presents student factors affecting mathematics achievement. Student factors could potentially vary among schools, among departments, or both schools and departments. Another group of five variables were found to be associated with test scores, either negatively or positively:

- There was a significant gender gap in mathematics achievement. On average girls scored about 3.4 points below boys. The gender gap varied significantly among schools. This variation is highlighted by comparing the gender gap at a school where the effect was one standard deviation (SD) above average with that in a school where the gender gap was one SD below average. The gender gap was approximately 7 points at schools where the gap was one SD above average, but disappeared at schools where the gap was one SD below average. Once the departmental poverty level was taken into account, the gender gap did not vary among departments. The gender gap was smaller in extremely poor departments.

- Over-aged students also scored significantly below students who were at the right age for the grade. The average effect was about 2.6 points and varied significantly among schools. At schools where the over-age effect was one SD above average, over-aged students scored about 5 points lower; however, at schools where the over-age effect was one SD below average, the over-aged students performed as well as the regular-aged students. The variation among schools was partially accounted for by the proportion of over-aged students in school. Over-aged students attending schools with a greater proportion of their peers performed better as the proportion of over-aged students increased. This might be related to a more effective teaching-learning environment when teachers did not have to cover a wider age-range within the same class. The student-level effect is not dependent upon the departmental poverty level.

- The student-level Quechua effect was not statistically significant at the 5 percent level, once the school and departmental effect were taken into account. Controlling for other variables, a Quechua speaking student would perform equal to a Spanish speaking student. However, the greater the proportion of Quechua speakers in a school, the poorer was the school's performance. This shows that Quechua speaking students are not inherently less able, but rather that schools that were attended predominantly by Quechua students, for reasons *not* identified in this model, performed poorly. Future research should investigate what might be the reasons for this phenomenon.

- Four variables which proxied parental expectations (as in the 2-level model) were statistically significant and in the expected direction. The effects of parent expectations were homogeneous throughout the country (the effects did not vary among schools or departments).

- Text materials mattered. Students without texts performed below students who had some form of text.[18] Again, this effect was homogeneous among schools and departments.

---

[18] In the two-level model this variable is broken into several possibilities, the level three model simply contrasts students without texts against all other students.

121

*(c) Variance in outcomes attributable to differences between students, between schools, and between departments*

The unconditional models for three-level analysis found that 12 percent of the variance in math test scores was attributable to differences in characteristics between departments. Within departments, 43 percent of the variance in test scores was attributable to characteristics between schools. Within schools, 45 percent of the variance was due to characteristics among students within schools. (Equations 1-6).

Table 11 displays the amount of variance explained by variables at all three levels. Cumulatively, student ascriptive characteristics, text materials, and parental roles and expectation explained 3.8 percent of the variance in achievement between students; school enrollment characteristics, geographic, public or private sector, teacher and principal characteristics explained 33 percent of variance between schools; ascriptive characteristics, public or private sector, teacher characteristics, and household expenditure explained 43 percent of variance between departments. That the amount of variance explained by student-level variables was reduced from those in Table 7 is because the variables have been reduced from the previous model. That the variance explained by department-level variables is substantially less than those percentages reported in Table 9 is because these are conditioned on the lower level variables in the model.

**Conclusion.** The findings of this analysis yield positive messages. In spite of the gap in mathematics outcomes between gender, region, rural and urban areas, private and public schools, and the coast, mountain, and jungle, after controlling for a number of explanatory variables the picture has changed. Students in poor and extremely poor departments performed better than those in nonpoor and average departments, holding other variables constant. Some departments were doing a better job in educating over-aged students. The gender gap was less pronounced in extremely poor departments. Aymara students performed equally well as Spanish speaking students. Quechua students could perform equally well if they were not attending predominantly Quechua schools, thereby indicating that the problem lies in the schools, not in the students. Teachers graduated from universities, teachers graduated from ISPs, teachers with longer years of service, and teachers who have had more in-service training were associated positively with student achievement nationwide. Nonavailability of text books was negatively associated with outcomes. Parental expectation for better performance in the relevant subject was translated into higher student performance.

It may be recalled that the existing sample excluded single-teacher schools in the remote areas which concentrated in the Sierra and Selva regions. If these schools and students were distributed equally across all departments in the Sierra and Selva and were included in the sample, they might not pull down the averages at the student, school, or departmental levels, but they could increase the standard deviation. If they concentrated in a few departments, they might pull down the average of those departments. In either case, if these rural schools and students were included in the sample, the variance between departments and between schools would most likely increase, which, in turn, would proportionally reduce the variance within schools (between students). Given that teachers in remote schools have lower academic qualifications, fewer in-service trainings, and less years of services, the effects of these variables could be larger.

122

If single-teacher schools were included in the sample, would it change the optimistic observations of this analysis? It would probably modify but not substantially change the outlook. Given the very large positive coefficient in the extremely poor departments (11.76 and statistical significance at $p. <= 0.01$ level in the final model), even if the sample included single-teacher schools and students, the performance of the high poverty departments might still be marginally better than the other departments, when other explanatory variables were held constant. However, the smaller coefficient in poor departments (6.01 and significance at $p <= 0.05$ level) might be further reduced or lose its statistical significance. In this case, the observations for the extremely poor departments might still hold, but not for others. The finding for the Aymara may not change because they live closer to urban areas than other indigenous peoples. The negative effects of Quechua schools is likely to still hold or grow bigger. If most of the remote schools are in the jungle areas, there would be new findings on the determinants of their achievement. The finding on over-aged students is also likely to hold because teachers probably teach to the students in the middle age range and neglect the needs of the older and younger kids. Gender is likely to remain a serious issue.

Whatever the limitations of the existing sampling frame and dataset may be, they would not negate the importance of the findings and policy implications for the majority of the 4th Graders in the country. The findings point to the opportunity for public policy to make a real difference for disadvantaged students. *The interventions should be universal where the effects have nationwide impact (that is, little variation at the school and departmental levels).* These include textbook provision, teacher pre-service and in-service training, providing incentives for experienced teacher to remain in the profession, deploying qualified and experienced teachers to the rural areas, specific training to teach more effectively to over-aged students, and using the mass media and parents associations to enhance parents' role in supporting their children's education. *Where the effects vary across departments or schools, targeted interventions are desirable.* These include specific support for schools where Quechua (and other indigenous people) are predominant. This might require strengthening bilingual education and text materials. In better schools, special attention might need to be paid to bring girls and over-aged students up to the standards of other students. (See Table 4 in Volume 1 for a summary of the effects crossing between departments, schools, and students).

| 12) Household expenditure | 14.9 * | 43.5% |

Notes:

(1) Level-one model is a reduced form from that presented in the two-level analysis.

(2) Indicates whether the intercept varies significantly after variables are included in model.

(3) School-level (level-2) variables model the intercept only. This is also true for level 3 variables.

(4) The variance explained is substantially less than those percentages reported in Table 9 because these are conditioned on the lower level variables in the model.

* $P <= .05$.

# Background Note 5.
## Teacher Education and Professional Development[19]

**System of pre-service training.** Teacher education in initial, primary, and secondary education is under two modalities: (i) pre-service training with 10 semesters of academic studies in ISPs, Higher Education for the Arts, Physical Education, and Theology, and in the education faculties of universities; and (ii) professional studies of 12 semesters' duration for the currently serving teachers without credentials to attend classes during vacations and to use distance learning methods during the year. There are 318 ISPs and 38 universities authorized to train teachers in the regular mode.[20]

Of the ISPs, 138 are public and 180 private. Private ISPs absorb 61 percent of the enrollment. At the college level, there are more faculties of education in public universities (21 of 29 universities) than private (17 of 35). MED authorizes course offerings and prescribes curriculum in public and private ISPs, while the National Council for Authorization of Function of Universities (CONAFU), an autonomous organ under the National Council of Rectors, approves the course offerings of education faculties in universities. Since the universities are autonomous, they have more freedom to decide on the curriculum. The MED, the universities, and the ISPs do not conduct systematic consultation with each other regarding the curriculum or about the number of entrants or graduates on the basis of the projected need for qualified teachers. One of the reasons for the low passing rate at the teachers' selection test may be due to the lack of agreed curriculum of teacher training.

Public ISPs confer the professional title of "teacher" (Profesor) which is a nationwide title, with specification about the level and the specialty they can teach. Graduates from public ISPs are required to do a thesis on education research before they are conferred the professional title. Graduates from private ISPs are required to pass an exam set by the MED (according to a recent regulation, D.S. NO 008-98-ED). The universities can confer the academic title of Bachelor in Education (Bachiller en Educación) and the professional title of Licensed in Education (Licenciado en Educación). The teacher graduates from ISPs can obtain the title of Bachiller en Educación in the universities without passing an entrance exam. To obtain this title, it is required to attend two more semesters of complementary studies that universities organize for this purpose. The title of Bachiller en Educación allows continuation of studies in postgraduate work. The titles of Profesor and Licenciado are equivalent and give equal status in the public career of teaching (Ley del Profesorado, 1984).

The excess supply of teachers, accelerated by the rapid growth of private ISPs in the 1990s, may have compression effects on the level of remuneration for teachers. The proportion of university applicants who want to major in education declined from 27 percent in 1960–64 to 8–10 percent in the 1980s and 1990s. The quality of teacher education in the ISPs is alleged to be poor, and students in education faculties are alleged to have the lowest entrance scores among university aspirants. Not all of the students in ISPs enter teaching after graduation. To many, it is

---

[19] This analysis was undertaken by Maria Amelia Palacios.

[20] The sources are the preliminary results of the 1997 census of technical and pedagogical education, and information from the National Council of Rectors.

one of the relatively easy routes for entry into tertiary education. This also explains why students are willing to pay to enter private ISPs, in spite of the relatively low pay and prestige in education, as well as the instability of employment given the difficulty of getting appointed to a pensionable position.

**Characteristics of ISP students.** According to the 1997 Census of ISPs, 227,942 students were enrolled in public and private ISPs. 61 percent of them studied in public ISPs and 59 percent were females. Of those who studied in private ISPs (39 percent), 70 percent were females. Only 83 percent of those who are in teacher training proceed to teach in public schools, generally in the same department where they were trained. Most of these are from poor families. This explains why 30 percent of young people work when they study (Arregui, Hunt and Díaz, 1996). About one-third of students have a mother tongue that is not Spanish. The entrance examination in the regular program of pre-service training is not demanding; about 52 percent of applicants are admitted, although public ISPs are more selective than private ones (Arregui, Hunt and Díaz, 1996). The demographic trend of a growing young population, combined with relatively easy access and growth in the supply of pre-service training, explains why the number of applicants has not diminished, in spite of low prestige of the profession, low salaries, and lack of job security.

**Professional studies (for teachers without titles).** Since 1975, the training of teachers who do not have titles was considered an obligation of the state. After passing the Law of Teachers, the supply of public and private training programs increased significantly in the country since 1985. Created to be of a transitory nature, it has been ongoing due to the continuous demand. In 1996, the basic statistics of MED reported an enrollment of 30,753 persons in the professional program. Not all the participants, however, teach because many enter these programs in search of a profession.

In 1996, due to irregular functioning of professional studies and criticism of poor quality, MED restricted professional studies' course offerings in ISPs (51 in 1995) and did not renew the permit with universities (15 universities in 1995). Recently, it has also suspended the intake of new students in professional studies in ISPs, and only 10 public ISPs can continue until their students graduate. In the case of universities, in 1997, only the National University of San Marcos, with its campuses in Lima, Huaraz, and Tarapoto, has an enrollment of 1,439 students, of which 73 percent were in secondary education.

**Curriculum of pre-service training.** Pre-service training in public and private ISPs follows the same curriculum that was approved in 1985 by MED (R.M. No 759-85-ED), unless it is authorized to experiment with an alternative curriculum. The universities are autonomous and as such follow their own curriculum. In 1996, MED provided a pilot plan of modernization of teacher training in primary education. The pilot plan began with participation of 13 ISPs (of which 11 are public and 2 are private). In 1998, another 11 public ISPs joined the pilot (supported by the IDB); the new curriculum of teacher training in secondary education was added, with specialization in social science (7 ISPs) and natural science (10 ISPs). Meanwhile, there coexist in ISPs two curricula for pre-service training:

126

- *The basic curriculum for training teachers*. This is applied in approximately 50 public and private ISPs for the specialty in primary education, in all ISPs with the specialty in initial education, and in all the ISPs with the specialty in secondary education (with the exception of 10 pilots).

- *The pilot curriculum for pre-service training in primary education*. This is being piloted in 63 ISPs (of which 22 are public, 2 are private, and 39 are associated with public).

The following table compares two curricular proposals in three key features: the curricular organization, the number of hours and the credit assigned to each component, and the weight of the practicum. The pilot curriculum introduces three important innovations: (a) the organization of content in six new major areas; (b) integration of education research with studies; and (c) the early initiation into practicum and extension to the last semester to account for 21 percent of the total time of the training program.

| Table 1: A Comparison of Old and New Pilot Curriculum in Teacher Education | | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| | Old Curriculum (since 1985) | | | | Curriculum in the Pilot Plan (since 1996) | | | |
| Curricular areas | # of as-signment | # of hours | % | % of credit | # of sub-areas | # of hours | % | # of credit |

**Remuneration, qualifications, and professional development of teaching staff in ISPs.** The remuneration of ISP trainers is very low. In public ISPs, the average monthly pay is 680 soles for a workload based on 24 hours per week, and 850 soles for a 40-hour workload. However, the so-called workload is only a label and does not reflect the amount of work done. There is not much difference in private ISPs. These centers pay teachers by the hour, usually between 5 to 7 soles per hour. For a workload of 24 hours, a teacher in a private ISP would earn between 480 and 672 soles per month, less than those in a public ISP.

Teaching staff in ISPs are almost uniformly trained in the field of education (as opposed to a liberal arts education with specialty in history, mathematics, or physics). According to the 1997 census of teacher-training institutions, 83 percent of the teaching staff in public ISPs and 85 percent of them in private ISPs had a major in pedagogical studies. There are others who studied psychology, sociology, law, or engineering. According to the evaluation report of the pilot plan, 40 percent of the ISP teachers in the sample declared that they studied other fields. In 1993, 70

percent of the 4,558 teacher trainers in service worked in public institutions (Census, 1993). In 1997, the number rose to 7,658, but only 49 percent taught in public ISPs (Census, 1997) due to a rapid increase in private ISPs. Between 1990 and 1995, private ISPs grew by almost 17 times, stimulated by the government policy to promote private investment in education (Diaz, 1996). The analysis of teacher training in Peru by Arregui, Hunt and Díaz (1996) indicates that about half of the trainers in ISPs and universities were themselves trained in ISPs or Normal Schools, while the other half were trained in universities. Only 11 percent of ISP teachers in the sample were trained through professional studies.

About 52 percent specialized in secondary education, and 23 percent in primary education. Of the total staff, about 21 percent specialized in math and sciences. Among those graduates of regular programs and professional studies, the 1993 census found that 20 percent specialized in secondary education with emphasis in mathematics or science. Among secondary teachers, 36 percent specialized in mathematics and/or science. MED has authorized recently (R.M. No 289-98-ED) implementation of the pilot plan of Bachillerato, which is two years of postsecondary studies requisite for higher education. This proposal cut secondary education by a year. There is not yet an established curriculum to train teachers for this level of education. A major challenge to expansion of secondary education and the introduction of the new Bachillerato is undoubtedly the need to rapidly strengthen the academic and professional capacity of teacher educators.

There exist 47 postgraduate programs of study in education—39 at the master's level and 8 at the doctoral level. However, few of the trainers have themselves completed such postgraduate education. About 37 percent of trainers are studying in a university to obtain the Bachelor's degree, a second specialty, or a higher degree (Arregui, Hunt and Díaz, 1996). An evaluation study of the Pilot in 10 ISPs found that one-third of trainers in ISPs have a Bachelor's degree and one-fifth have a Master's degree.

Although the offering of in-service training in universities, ISPs, and NGOs has increased notably in recent years, the cost is beyond the reach of many trainers. Since 1996, MED began to finance the professional development of teacher trainers. In 1997, it trained about 300 ISP trainers through 13 courses and an international event in Lima (Evaluation of the Pilot Plan, 1998). The low salaries of ISP teachers is the main reason that they cannot access a more permanent form of training in the private sector.

**Diversification of pre-service training**. The more important efforts to diversify in-service training are those linked with training of indigenous teachers. About 17 percent of the Peruvian population speak Quechua (3.5 million) and 3.2 percent (half a million) speak other indigenous languages. However, teaching is conducted in Spanish in 95 percent of the education centers in the country. Of 2,706 bilingual schools in the country, 72 percent are in primary education. The majority of them (1,682 schools) teach in Quechua (1993 Census). The experience of diversification of teacher training can be summarized as follows:

(a) *The curricular model for pre-service and in-service training for teachers in bilingual and intercultural education.* In 1993, MED authorized a five-year experiment in diversification in 10 selected institutions (8 ISPs and 2 universities). Only 3 public ISPs out of 8 have experimented with part of the models for as much as seven months. The two public universities

have not even done that. Recently, an analysis of the experience is being conducted.

(b) *The professional training of teachers in Andian rural areas*. This has been ongoing since 1988, undertaken by the Technical and Pedagogical Higher Institute of Urubamba in conjunction with the Catholic University of Peru. Among the major contributions are the organization of curricular content and improvement of the articulation between theory and action.

(c) *The program to train bilingual teachers of the Amazon region*. This was developed by the Public ISP of Loreto in association with the AIDESEP in1998. It is a curriculum of six years of study in intercultural and bilingual education in primary education for the Amazon region. One of the more interesting innovations is the intensive and supervised practicum in the last two years of training that leads to the employment of students either as permanent or contract staff by the MED to teach in communities in the jungle.

## Issues in teacher education.

The main issues are as follows:

(a) *The quality of academic emphasis and pedagogy*. The divorce between theory and practice in teacher education has undermined the quality of teacher preparation. The universities emphasize theory at the expense of practice while the ISPs prefer the instruments of teaching at the cost of a solid foundation in the content of teaching.

(b) *The difference in academic status between the Profesor and the Licenciado* that requires the former to study for an additional year in university in order to complement this academic formation and to access postgraduate studies. This has contributed to the public perception that the Profesor is inferior to the Licenciado.

(c) *The lack of linkage between universities and ISPs in sharing innovations and research*. The evaluation of the pilot plan found that the trainers tended to initiate students in social research but not in education research, and that, although there are exceptions, few teachers in ISPs have pursued research themselves, leading to a loss of prestige.

(d) *The absence of incentives for teachers to strive for excellence*. The policy towards teacher remuneration is a major constraint (in terms of time and money) that does not enable teachers to use their own resources and outside of work hours for professional development. The ISPs do not have budgetary resources to support continuous development, and the state does not have a policy for professional development of the trainers of teachers, nor give much attention to those working outside big cities.

(e) *The unsustainable increase in the supply of teacher training*. The rapid growth in private ISPs in the 1990s has not been accompanied by evaluation of the quality of training. Since the MED has the only authority to grant permission to the operation of private ISPs, it can also plan a more adequate system of teacher training by taking into account vacancies, specialties, and differential demand for teachers by department/areas. The mechanism of accreditation and supervision of the quality of service of private ISPs should be the first area of concern.

(f) *The persistence of untrained teachers is a serious issue.* They vary by level of education, accounting for 43 percent in initial education, 41 percent in primary education, and 55 percent in special education. In addition, there are untrained teachers in secondary education. Professionals from other careers who do not have pedagogical titles but wish to become part of the teaching profession have followed the same complementary program in some universities in order to enter a public teaching career. However, it is not clear whether this is authorized by MED.

(g) *There is no evaluation of the quality of teacher education:* availability of qualified human resources and support materials (such as libraries, instructional materials, access to computers), the relevance of teacher education to the reality and diversity of the student population, and the efficacy to develop in the majority of students the competencies teachers want in their professional profile.

## Options for improvement

These are as follows:

(a) *Promote education research along with extending access to information about teacher training.* Teachers in different cultural and socioeconomic contexts should produce their own knowledge. This production can be advanced by interchange with educators in the world. ISPs should strengthen collaboration with education researchers. MED can promote and coordinate a research agenda for teacher education.

(b) *Support directors and trainers in the ISPs* by making available the necessary conditions for innovation: continuous professional development in their work center and outside, scholarships for study abroad, teaching materials to support innovation, access to journals and publications that inform trainers about innovation in their area of work, freedom to experiment, and opportunity and time to disseminate the results.

(c) *Progressively improve teacher incentives.* Economic and noneconomic incentives should be designed to increase work satisfaction: such as stimulus for innovators, opportunity for professional development linked to classroom needs, supplying modern instructional materials, encouraging professional knowledge of students and parents, raising teachers' authority with the community, and fostering a climate favorable for group work.

(d) *Evaluate the results of training programs, particularly those where great resources and efforts have been invested.* For example, the impact of the national plan to train teachers and education management (PLANCAD and PLANCGED) should be evaluated to assess the improvement in the linkage between teacher training and reality of public schools. There should be a permanent system of evaluation of practicum in public schools. This needs to be a combined internal and external evaluation that takes account of the experience and knowledge of trainers, authorities, and students, and detects problems and proposes solution to the deficiencies.

. (e) *Design a new strategy to qualify the teachers without titles.* It should be offered exclusively to current serving teachers without titles; organized and executed by accredited public and

130

private institutions, supported with proper resources to ensure that it achieves its objective; and giving priority to those education levels and departments where unqualified teachers are most numerous (Loreto, Madre de Dios, Callao, Huancavelica, San Martín, Amazonas, and Ucayali.)

(f) *Plan the supply of training collaboratively among the MED, the universities, and the ISPs.* Since the state is the major employer of teachers, it is indispensable that it articulate supply and demand (Diaz, 1996).

(g) *Recruit and select diverse applicants for teacher training.* New mechanisms should be designed to select candidates for teacher training by attracting youth from diverse social sectors and including professionals from other careers.

(h) *Organize continuous professional development of teacher trainers to be financed by the state* by taking into account the following elements: (i) a process of professional development linked with the reflection of teaching practice; (ii) a training centered in the ISPs that can take account of the specific needs of teachers; (iii) encouragement of the participation of trainers in the process of reform of the teaching profession; (iv) involvement of teachers in planning and evaluation of the training program; and (v) incorporation of innovations and lessons of experience from the nation's classrooms.

## Appendix 4.7: (continued)

| Primary education | |
|---|---|
| Percentage of students who reached Grade 6 | 81% |
| Percentage of students who reached Grade 6 without repeating | 40% |
| Percentage of students who graduated to Grade 7 | 78% |
| Total percentage of drop out after primary education | 22% |

| Secondary education | |
|---|---|
| Percentage of students who reached Grade 11 | 60% |
| Percentage of students who reached Grade 11 without repeating | 20% |
| Percentage of which graduated from Grade 11 | 58% |
| Total percentage of drop-outs after secondary education | 43% |

| Average number of years spent in the public education system | |
|---|---|
| **Entire cohort** | 9.9 |
| Those enrolled in Grade 6 | 7.3 |
| Those enrolled in Grade 11 | 13.3 |
| Dropouts | 6.7 |
| | |
| **Student-years spent** | |
| In primary education | 7.6 |
| In secondary education | 16.4 |
| **Input-output ratio** | |
| In primary education | 1.3 |
| In secondary education | 1.4 |
| In secondary education | 1.4 |

# APPENDIX 5

## INTERNATIONAL COMPARISON OF

## BETWEEN-SCHOOL VARIATION IN ACHIEVEMENT

# Appendix 5.1: International Comparison of Between-School Variation in Achievement by Selected Countries

| Country (year of study) | % between schools | With pretest | After controlling for SES |
|---|---|---|---|
| Peru (1998) | | | |
|     Math Grade 4 | 58 | | |
| Colombia (1992) | | | |
|     Spanish Grade 1 | 18 | | |
|     Spanish Grade 3 | 29 | | |
| Egypt (1992) | | | |
|     Math Grade 5 | 60 | | 59 |
|     Science Grade 5 | 41 | | 41 |
|     Arabic Grade 5 | 53 | | 51 |
| Honduras (1992) | | | |
|     Reading Grade 1 | 33 | | |
| Pakistan (1992) | | | |
|     Math Grade 4 | 52 | | 51 |
|     Science Grade 4 | 52 | | 53 |
|     Math Grade 5 | 49 | | 52 |
|     Science Grade 5 | 50 | | 50 |
| Thailand (1991a) | | | |
|     Math Grade 3 | 31 | | |
|     Thai Grade 3 | 35 | | |
| Thailand (1991b) | | | |
|     Overall Grade 6 | 48 | | |
| Zimbabwe (1988) | | | |
|     English Language Grade 7 | 42 | | |
|     English Literature Grade 7 | 42 | | |
|     Math Grade 7 | 42 | | |
| Zimbabwe (1991) | | | |
|     English Grade 7 | 47 | | |
|     Math Grade 7 | 60 | | |
| Zimbabwe (1992) | | | |
|     English Grade 7 | 56 | | 47 |
|     Math Grade 7 | 74 | | 36 |
| Botswana (1992) | | | |
|     English Form II or Grade 8 | 12 | | |
|     Math Form II or Grade 8 | 16 | | |
| Brazil (1990) | | | |
|     Math Grade 9. | 62 | | |
|     Portuguese Grade 9. | 36 | | |
| Egypt (1992) | | | |
|     Math Grade 8 | 42 | | 40 |
|     Science Grade 8 | 35 | | 32 |
|     Arabic Grade 8 | 29 | | 26 |
|     English Grade 8 | 43 | | 39 |

| Appendix 5.1: (continued) | | | |
|---|---|---|---|
| Philippines (1991) | | | |
|     Math Grade 8 | 52 | | |
|     Science Grade 8 | 43 | | |
| Thailand (1989) | | | |
|     Math Grade 8 | 32 | 11 | |
| Zimbabwe (1988) Grade 8 | | | |
|     English Form IV or Grade 10 | 42 | 27 | 21 |
|     English Literature Form IV | 48 | 26 | 26 |
|     Math Form IV | 44 | 23 | 18 |
| Zimbabwe (1991) | | | |
|     English Form II or Grade 8 | 65 | 47 | |
|     Math Form II or Grade 8 | 61 | 51 | |

## Appendix 5.2: International Comparison of Between-School Variance in IEA International Study on Reading, 1990

| Participating country | 9-year-old level | 14-year-old level |
|---|---|---|
| Belgium (French) | 16 | 40 |
| Botswana | - | 16 |
| Canada (British Columbia) | 21 | 27 |
| Cyprus | 13 | 15 |
| Denmark | 12 | 8 |
| Finland | 8 | 2 |
| France | 14 | 35 |
| Germany (former West) | 13 | 49 |
| Germany (former East) | 15 | 10 |
| Greece | 35 | 22 |
| Hong Kong | 33 | 43 |
| Hungary | 21 | 23 |
| Iceland | 9 | 8 |
| Indonesia | 37 | - |
| Ireland | 16 | 48 |
| Italy | 33 | 28 |
| Netherlands | 13 | 50 |
| New Zealand | 19 | 41 |
| Nigeria | - | * |
| Norway | 5 | 6 |
| Philippines | - | 61 |
| Portugal | 29 | 27 |
| Singapore | 22 | 52 |
| Slovenia | 10 | 12 |
| Spain | 18 | 22 |
| Sweden | 9 | 8 |
| Switzerland | 10 | 48 |
| Thailand | - | 66* |
| Trinidad and Tobago | 32 | 58 |
| United States | 19 | 42 |
| Venezuela | 33 | 29 |
| Zimbabwe | - | 46* |

Source: Andreas Schleicher and Jean Yip, Indicators of Between-School Differences in Reading Achievement, 1994, mimeo.

* Nigeria was excluded from the calculation because it did not provide sufficient information on the identification of schools and also because of insufficient sampling information. Thailand and Zimbabwe also did not meet the IEA sampling standards.

# APPENDIX 6

# PUBLIC EXPENDITURE ON EDUCATION

# Appendix 6.1: Gross Domestic Product, Total Government Expenditure, and Total Public Expenditure on Education, 1970-1997
## (Million Soles in current prices)

| Years | Gross Domestic Product (1) | Total government expenditure (2) | Public expenditure on education */ (3) | Public expenditure on education without pensions */ (4) | Revenues of central government (5) | Public expenditure on education as % of GDP (3/1) | Public exp. on education as % of total government expenditure (3/2) | Total govt. expenditure as % of GDP (2/1) | Central government revenues as % of GDP (5/1) | Govt. expend. as % of revenues of central govt. (2/5) | Public exp. on educ. as % of revenues of central gov. (3/5) | Public exp. in educ. without pension as % of GDP (4/1) | Public expenditure on education without pension as % of govt. expenditure. (4/2) |

# APPENDIX 9

# EXTERNAL SUPPORT FOR EDUCATION SINCE 1990

| Appendix 9: External Support for Education since 1990 | | | | | |
|---|---|---|---|---|---|
| Organization | Loan or grant amount (US$) | Implementation dates | Implementation agency | Description of the project | Problems/solutions |
| World Bank | 146,400,000 | 1995-2000 | Ministry of Education | **Basic Education Quality Project.** The objective of the Project is to assist the MOE to improve the quality of its public primary education, to improve student achievement, and to reduce the incidence of repetition and dropout. It has the following components: (1) Education Quality Improvement, including (a) curricular reform, (b) provision of textbooks and didactic materials, and (c) in-service teacher training; (2) Modernization of Educational Administration including (a) a program to improve the management by MOE of the educational system, (b) the Pilot Plan for Modernization of School Management, (c) program for decentralization of the sector, (d) the establishment of an MIS, (e) the development of a student assessment system; and (3) Infrastructure Improvement through (a) the construction and rehabilitation of schools, (b) the provision of furniture for these schools, and (c) the development of a maintenance program. | Main problem identified is the slow implementation rate of the infrastructure component. |
| Inter-American Development Bank | 500,000 | 9/96-12/97 | Ministry of Education | **Education Sector Reform Project (PPF).** Preparation facility for Project below | |
| Inter-American Development Bank | 100,000,000 | 12/96-12/2001 | Ministry of Education | **Special Program for the Improvement of Education Quality.** Project components are: (1) Institutional strengthening of the Ministry of Education, including Teacher Performance Improvement System, Education Quality Measurement System, strategic planning, strengthening of teacher pre-service training schools, management training, and preschools; (2) strengthening of the 5-year-old program, including curriculum development, educational material, in-service teacher training, and infrastructure; (3) strengthening of secondary education, including curriculum development, educational materials, in-service teacher training, and quality networks; (4) education for work, including modernization of the public offer and curriculum development. | Main problem identified is slow implementation rate. Proposed solution is to strengthen Project Coordination Unit and hire consultants to provide support to activities being carried out within the Ministry. |

| Appendix 9: (continued) | | | | | |
|---|---|---|---|---|---|
| UNFPA | 246,500 | 6/96-12/97 | Ministry of Education | **Support to Communication Activities on Population at the National Level.** Review and publication of the Sex Education Guidelines for teachers and parents | Slow progress in teacher training and in distribution of the Guidelines. |
| UNFPA | 144,728 | 12/95-6/97 | Asociación de Trabajo Laico Familiar (ATLF) | **Education on Responsible Parenthood and Information on Natural Methods for Family Planning for Adolescents in Lima and Callao.** The objective of the Project was to contribute to the National Education Program on Population by promoting and stimulating awareness on population dynamics. The goal was to improve knowledge and abilities in 1,500 teachers and 5,000 parents to provide counsel to adolescents on planned parenthood and sexual education. | Main problem identified was the lack of sustainability of the recipient institution since it is completely dependent on external funds. |
| UNFPA | 515,657 | 10/96- ongoing | Centro de Estudios Para el Desarrollo Regional (CEDER) and Regional Council for Population from Arequipa | **Sex Education of Adolescents in the Arequipa Region.** The objectives of the project are to contribute substantially to the sexual education in Arequipa from a gender perspective through research, socialization, and initiation of a training model for teachers and health professionals. The aim is to generate change in 1,082 teachers and 26,000 students from 973 schools, and in 20 health professionals and 800 adolescents not attending schools from rural and urban areas. | Main problem identified is to attract and keep interested those adolescents who are not part of the school system. |
| UNFPA | 222,230 | 11/97- ongoing | Ministry of Education | **Preparation for the Project providing support to the National Program on Sex Education.** The objective of the Project is to contribute to the National Population Program 1996-2000, through the generalized training on Sex Education for secondary school students and the development of the Family and Sex Education Guidelines. | The Guidelines should be drafted to respond to the conditions of the various regions of the country. |
| GTZ | 1,984,802 | 3/1996-6/1998 | Ministry of Education | **Preparation for the Reform of the Teacher Training Program.** The objectives of the Project were: to develop a new concept and strategy for primary education teacher presence training and to integrate bilingual intercultural education and gender issues in the primary education reform. | The main problem identified was the difficulty in communication and coordination between the various actors. |

| | | | | Appendix 9: (continued) | |
|---|---|---|---|---|---|
| European Commission | 5,000,000 | 12/97- 12/98 | Ministry of Education | **Support to the Basic Social Expenditure "Educación Básica para Todos."** The project finances the production, procurement and distribution of educational material in Spanish for third and fourth grades and bilingual materials for first and second grade to be used in single and multi-grade schools located in the rural sierra and jungle. It also provides teacher training for the use of these materials. The Project also finances a team of consultants in the definition of guidelines and strategies to improve the quality of rural education. | There are coordination difficulties at the technical and financial levels. There is overlap in the various programs under execution in the Ministry. |
| European Commission | 8,082,622 | 6/96 – 12/01 | Ministry of Education | **Development and Insertion of Youth in Peru.** The Projects is targeted to a population group between the ages of 15 and 24 who abandoned the education system without completing a professional education. It is based on the network of the Public Higher Education Institutes in La Libertad and Cajamarca and includes the following activities: Professional training, available training resources, management of resource and centers, technology transfer, business orientation, pedagogical innovations. | There is adequate coordination for this program at the central and regional level. There are problems with counterpart funds and administrative delays. The sustainability of this process depends on a flexible and agile training program linked to the productive environment. |
| European Commission | 8,082,622 | 1/98-1/03 | Ministry of Education | **Professional Technical and Pedagogical Training Program.** This program is divided into two parts: The Horizontal Project for Teacher Training in Technical Education has as its main objective the improvement of the quality of the technical and professional training system. This Project has national coverage and will be executed through 13 Magnet Schools. It will target to 10,650 teachers of technical subjects. The second part is the Teacher Training Program in Bilingual Intercultural Education in the Amazon Basin and has as its main objective the integration of indigenous communities in the jungle through teacher training, applied research, and development of curricular and didactic materials. This Project will benefit 1,000 teachers and 100 teacher trainers. | There is good and fluid coordination. |

| Appendix 9: (continued) | | | | | |
|---|---|---|---|---|---|
| European Commission | 810,000 | 11/95 – 12/97 | Ministry of Education | **Pedagogical and Technological Training and Research in Education-Related Disciplines.** The Project objective is to contribute to the improvement of technical education through training on science and technology of teachers from Technical Schools. The Project created Training Networks in eight cities in Peru. | The Project concluded successfully. |
| USAID | 2,974,668 | 9/92 – 9/96 | Partner for the Americas | **Peruvian Program of Scholarships for Peace.** The program provided leaders and potential leaders with specific abilities, training, and academic education, as well as understanding about the operation of the democratic process in a country with a free market economy. | |
| USAID | 664,000 | 9/96 – 9/99 | UNICEF | **Transit to Primary Education.** Support to the MOE in its efforts to improve the quality of public education. | Substantial improvement is needed in the quality of education in the first and second grades to be evaluated through entry and exit tests. |
| USAID | 362,000* | 8/95 – 12/99 | CARE | **Strengthening of Health Institutions.** The southern component of this Project includes a subcomponent that provides financing for basic education activities in the "Aymara" population in Puno. | |
| USAID | 2,300,000 | 1/98 – 1/2 | CARE | **Girls Education.** The project aims toward the development of guidelines to identify barriers and long term solutions with respect to the education of girls and committing leaders from public and private sector organizations to promote policies and programs that will improve the opportunities and quality of education for girls. | |

| Appendix 9: (continued) | | | | | |
|---|---|---|---|---|---|
| DIACONIA Lutheran Evangelical Association for Assistance to Community Development | 644,000 | 97-01 | Ministry of Education | **Schools Agricultural Production Unit.** The Project aims to improve the living conditions of the rural child and his/her family through the improvement of diet and health by promoting the harvest and consumption of vegetables produced with agroecological techniques. It also contributes to the improvement of Primary Education through the development of a curriculum for rural areas. | High levels of malnutrition. Education in rural schools is geared towards memorization and not oriented to the learning process. High rotation rate of teachers trained by the Project. Lack of identification of teachers with the community. Lack of training materials. |
| UNESCO/ DANIDA | 311,400 | 6/96 – 6/00 | Ministry for the Promotion of Women and Human Development (PROMUDEH) | **Alphabetization and Civic Education of Indigenous and Displaced Women in Peru.** The objective is to promote the use of civic, cultural, and gender rights of indigenous and displaced women to overcome analphabetism and exclusion. | Project had problems due to change in implementation institution (from MOE to PROMUDEH). |
| UNESCO/ DANIDA | 553,700 | 1/96 – 12/98 | Ministry of Education | **Integration of Handicapped Children in Regular Schools.** The objective is to consolidate school integration through teacher training, specialized support to teachers, socialization activities, teacher supervision, and distribution of educational materials | Lack of an institutional framework in the process. |
| Save the Children | 172,635 | 3/93 – 7/96 | EDUCA – Institute for the Quality of Education / Arariwa | **Health and Development Education in Schools of the INKA Region.** The objective of the project was to promote the development and application of child integrated attention in 40 schools in the Inka Region. The project benefited 1,600 children and 60 teachers. | Difficulty in integration of project activities within the school. |
| Save the Children /European Union/ ADAR | 67,388* | 4/97 – 3/99 | Asociación para el Desarrollo Amazónico Rural (ADAR) | **Community Development in Native and Mixed Communities of the Peruvian Amazon Basin.** The objective of the project is to train and provide assistance to community leaders and workers to manage a rural development model based on primary health, basic sanitation, and nutritional assessment. The Project includes a component of health education developed within the school setting. | Implementation of this type of project requires a strong monitoring and evaluation system |

| Appendix 9: (continued) | | | | | |
|---|---|---|---|---|---|
| Spanish Agency for International Cooperation (AECI) | 817,458 | 93-98 | Ministry of Education | **Design of the Technical Education and Professional Training System.** The Project is developing a national certification system for teachers and technical education, the curriculum for a selection of professions, and the Program for teacher training within the professional training system. | |
| Spanish Agency for International Cooperation (AECI) | 880,525 | 92-98 | Ministry of Education | **Quality of Education and Regional Development.** The Project aims to improve teacher training, certification and quality in the Teacher Training Institutes. The Project contributes to the development of the second specialization in teacher training. Activities are developed through distance education to facilitate teacher participation. | |
| Spanish Agency for International Cooperation (AECI) | 1,331,267 | 92-98 | Instituto Superior Pedagógico Loreto and AIDESEP | **Bilingual Teacher Training in the Peruvian Amazon Basin.** The project has developed a bilingual intercultural teacher training curriculum, and trains teachers from various indigenous nations on bilingual intercultural education is to contribute to the development. | |
| Spanish Agency for International Cooperation (AECI) | 500,000 | 97-98 | Ministry of Industry, Ministry of Education, PROMPEX and Leather and Shoe Associations | **Assistance to the "Instituto Superior Tecnológico del Calzado."** The Project provides support to development and activities of the above institution. | |
| Spanish Agency for International Cooperation (AECI) | 382,406 | 94-98 | Asamblea Nacional de Rectores, Foreign Relations Ministry | **University Cooperation Program.** The Program finances the exchange of professors, managers, and students between Latin America and Spain. To date it has benefited 678 students and 340 professors. | |
| Spanish Agency for International Cooperation (AECI) | 1,600,000 | 96-98 | Ministry of Foreign Relations, Ministry of Education, INABEC, CONCYTEC, Ministry of the Presidency | **Program for Training of Human Resources.** The Program provides study grants for Peruvian professionals to travel to Spain. To date it has benefited 102 people. | |

* Amount reflects the education component of the larger project.

| | | | | | |
|---|---|---|---|---|---|
| | | Appendix 9: (continued) | | | |
| Organization | Loan or grant amount (US$) | Implementation dates | Implementation agency | Description of the Project | Problems/ solutions |
| UNICEF | 11,430,600 | 1992-1998 | Ministry of Education | **Basic Education.** The objective of the Project is to contribute to national efforts to reduce educational exclusion and to compensate for inequities in the use of basic education rights. Specifically the Project aims to (a) strengthen the educational management at the local and subregional levels in 10 departments through joint management initiatives and improving social control of results in schools; (b) improve by 30 percent the student learning performance in communication, interpretation, and production of texts and problem resolution; and (c) implement the proposed increase of 20 percent of effective learning time through the development of complementary learning spaces. The project includes technical assistance, advocacy activities, provides support to local organizations, and provides schools with basic educational materials. | |
